Sky Survey Atlas Reject Fields Latitudes -20 and 20 Degrees

83-004A-01u

This data set consists of one tape. It contains 151 fields covering the lower ecliptic latitudes between -20 and 20 degrees. The binary data are written in tar format with FITS headers, blocked at 20, on a low density, 8 millimeter and 4 millimeter tape.

The D and C numbers along with the plate numbers follow:

D #	C #	File	Type	Plate Numbers
D-107721	C-031539	1	All hcons	85 - 215
		2	All hcons	216 - 346
		3	hcon0	85 - 346

When executing VMSTAR, or loading FITS files online always mount the tape specifying blocksize, recordsize and density.

Greenbelt, MD 20771

Dear Michael,

The enclosed 8mm tape contains 151 ISSA Reject fields covering the lower ecliptic latitudes between -20 and 20 degrees. This set is reduced in quality compared to the rest of the ISSA fields due to contamination by zodiacal emission residual and therefore these fields are NOT part of the ISSA set and should always be referred to as a separate product. Care should be taken in using these fields. An explanation of their use will be in the ISSA Explanatory Supplement which is expected mid-1993.

The first file contains all hcons for fields 85 - 215 and the second file contains all hcons for fields 216 - 346. The third file contains all the coadded fields.

Sincerely,

Sherry Wheelock

This data set consists of four, eight millimeter tapes. The FITS files are written to tape in TAR format using SUN/SPARC workstations operating under UNIX with X-windows. The first three tapes are available on cd-rom, and are generally distributed as such. A TAR list in is included on the following pages. The D and C numbers, along with the data types for each tape follow:

D#	C#	Tar files

H. McCallon, C. Oken, J. White, D. Gregorich,
F. Boulanger and T. Chester

INTRODUCTION

This memo accompanies the second release of the IRAS Sky Survey Atlas (ISSA) which covers the ecliptic latitude sky, $50^\circ > |\beta| > 20^\circ$, with some coverage down to $|\beta| \sim 14^\circ$. A CD-ROM set containing ISSA images covering the entire sky will be released in 1993.

Information about IRAS and ISSA

The Infrared Astronomical Satellite (IRAS) conducted a survey of 98% of the sky from low Earth orbit in four wavelength bands centered at 12, 25, 60 and 100 μm during a ten month period from January to November, 1983. An initial set of infrared images of the sky, released in 1984 and in 1986, had limited sensitivity due to zodiacal emission and calibration limitations. The Infrared Processing and Analysis Center (IPAC) reprocessed the IRAS data to improve calibration and remove the zodiacal emission. The results of the reprocessing are now available as the IRAS Sky Survey Atlas (ISSA), also referred to as Super Skyflux (SSF). There will be two releases of the ISSA images. The first release (1/92) covers the high ecliptic latitudes ($|\beta| > 50^\circ$) and is available on CD-ROM through NSSDC. The second release (9/92) covers the mid-ecliptic latitude ($50^\circ > |\beta| > 20^\circ$) sky. The remaining unreleased fields covering ecliptic latitudes between -20° and 20° are affected by emission from the zodiacal bands. This set will be released under separate cover in 1993 and will be considered a separate product since special care must be taken when using them. An explanation of their use will be in the ISSA Explanatory Supplement (Wheelock *et al.* 1993) which will be released at the same time. *Reject*

The scientific motivation for ISSA is to present the infrared images of the entire sky as measured by IRAS at spatial scales larger than about 5'. The combination of calibration improvements and removal of most of the zodiacal emission results in a sensitivity that is now limited by detector noise or confusion noise across most of the sky.

The ISSA images were designed to give relative photometry for objects outside the solar system and should *not* be used for determining the absolute surface brightness of the sky. The ISSA Explanatory Supplement provides important details about the absolute calibration of IRAS.

Complete details of the designs of the IRAS telescope and instruments, the IRAS sky survey and the IRAS data processing system along with extensive descriptions of the IRAS data products are contained in the Explanatory Supplement of the IRAS Catalogs and Atlases (Beichman *et al.* 1988).

Before using the ISSA images, refer to the cautionary notes and processing caveats presented in this memo.

The IRAS Sky Survey Atlas

The IRAS Sky Survey Atlas is a set of machine-readable images in Flexible Image Transport System (FITS) image format. Each 500×500 pixel image covers a 12.5° by 12.5° field of sky with pixel size of $1.5'$. Spatial resolution varies between $4'$ to $5'$ depending on wavelength. The fields are spaced every 10° in declination. In right ascension, the spacing varies due to convergence at the poles. Field numbering starts at the south equatorial pole as shown in Figure 1.

For each field and IRAS wavelength (12, 25, 60 and $100 \mu\text{m}$) there is an intensity image for each confirming coverage (HCON-1, HCON-2 and HCON-3) plus a coadded image (identified as HCON-0) of all the coverages. Scan coverage and noise images were also produced and are available from IPAC upon request.

The first release of 162 ISSA fields, available on CD-ROM from NSSDC, covers 38% of the sky with complete coverage of ecliptic latitudes, β , from 50° to 90° and from -50° to -90° . The entire $|\beta| > 50^\circ$ set of intensity images occupies ~ 1.8 gigabytes. The FITS intensity images are either 16 or 32 bits per sample depending on noise level and dynamic range of signal.

The second release of 117 ISSA fields covers ecliptic latitudes, β , from 50° to 20° and from -50° to -20° (27% of the sky). This set of intensity images occupies ~ 1.1 gigabytes and is available through NSSDC. It is currently not available on CD-ROM.

All ISSA images are also available at IPAC for use at IPAC.

CAUTIONARY NOTES

Confirmation of Sources

Non-confirming objects (those objects that appear in only one HCON intensity image) are visible on the ISSA images. These objects may be orbiting satellites, asteroids or space debris. If not removed, they could appear in the coadded image since *no* confirmation scheme was used in producing the coadded ISSA images. Therefore, for each ISSA field, all individual HCON intensity images were examined visually to identify objects appearing in only one HCON image. When found, the contaminated portion of the offending scan was identified and removed. Less than 1% of the entire survey database was removed by this visual inspection process. Even though care was taken to remove all anomalies, some undoubtedly remain and appear in the coadded image. Individual HCON images can be examined to verify the reality of features seen in the coadded images.

Solar System Debris

Emission from solar system material remains in the data and can cause confusion with more distant objects. This includes some asteroids, zodiacal dust bands, comet tails and comet trails. Only known asteroids as of the 1986 publication of the IRAS Asteroid and Comet Survey were removed prior to making the coadded images.

The zodiacal dust bands are seen in different aspects in different HCONS and will appear as non-confirming extended emission bands parallel to the ecliptic plane at ecliptic latitudes less than 10° . None of the images in the first ISSA release contain the dust bands. Some of the fields in the second release that cover down to $\sim 14^\circ$ may have a residual effect from the dust bands, resulting in a surface brightness change (across ecliptic latitude) of 0.5 to 1.0 MJy/sr at 12 and $25 \mu\text{m}$, respectively.

Both comet tails and trails are seen in the data. Comet tails, caused by either charged ionized particles blown by solar wind or neutral particles blown by radiation pressure, appear when the comet is closest to the sun. The tail of comet IRAS-Iraki-Alcock is visible in some fields near the north ecliptic pole (fields 416 and 418). Comet trails, composed of larger dust particles insensitive to radiation pressure, spread along the orbit of the comet and accumulate over a long period of time. In the ISSA images comet trails appear as

streaks crossing the image nearly perpendicular to the scan direction. Four fields (166, 167, 128, 129) in the second release are affected by known comet trails.

Absolute Radiometry

The ISSA was designed to provide relative brightness measurements over spatial scales above 5'. A background was removed from the ISSA data; therefore, the images should *not* be used for observing absolute sky surface brightness.

There is an ongoing effort with COBE scientists to understand the calibration differences between the IRAS and DIRBE data for measurements of sky brightness on large spatial scales. IPAC newsletters and the final version of the ISSA Explanatory Supplement are expected to contain results of this work. *The accuracy of the IRAS point source calibration is not and will NOT be impacted by the results of this comparison.*

Point Source Photometry

ISSA is designed to study extended structures in the survey data and has *not* been optimized for accuracy for sources smaller than 5'. Point sources are *not* optimally analyzed with this product. The *IRAS Point Source Catalog*, the *IRAS Faint Source Survey* or the *IRAS Small Scale Structure Catalog* should be consulted for point sources.

PROCESSING CAVEATS

Mosaicking

Most images in the second release can be mosaicked without additional flat-fielding to an accuracy of ~ 0.1 MJy/sr. However, near the galactic plane the field difference can be 0.5 MJy/sr at 12 and 25 μm . This capability is due to the use of a global destriping algorithm which brought all confirming coverages of the sky to a common background level.

Saturated Data

An error was found in the algorithm for handling saturated intensity values. The error eliminated the wrong detector when saturation occurred and affects the original images as well as the entire set of ISSA images. As a result, saturated intensity values were included in the images while non-saturated intensity values were erroneously eliminated. This effect occurs mainly in the Galactic plane where the 60 and 100 μm detectors saturate, but is not considered a significant problem since it affects less than 0.1% of detector data.

Mission Overlap

Residual zodiacal emission remains in the ISSA images due to imperfections in the zodiacal model. The worst problems occur at 12 and 25 μm around 60° and 240° ecliptic longitude. The 60° point marks the beginning of the descending leg and the 240° point marks the beginning of the ascending leg of the HCON-1/HCON-2 survey. Six months later the descending leg had progressed to the 240° point and the ascending leg to the 60° point. Thus, the same part of the sky was viewed six months later through a different part of the zodiacal dust cloud. The peak magnitude of the change in the intensity along this longitude occurs at -15° ecliptic latitude and is 2.0 MJy/sr at 12 μm , which is about 7% of the local intensity prior to zodiacal emission removal. For the $|\beta| > 50^\circ$ sky, the worst discrepancy at 12 μm is 5% of local intensity prior to zodiacal emission removal; it is 2% at 25 μm .

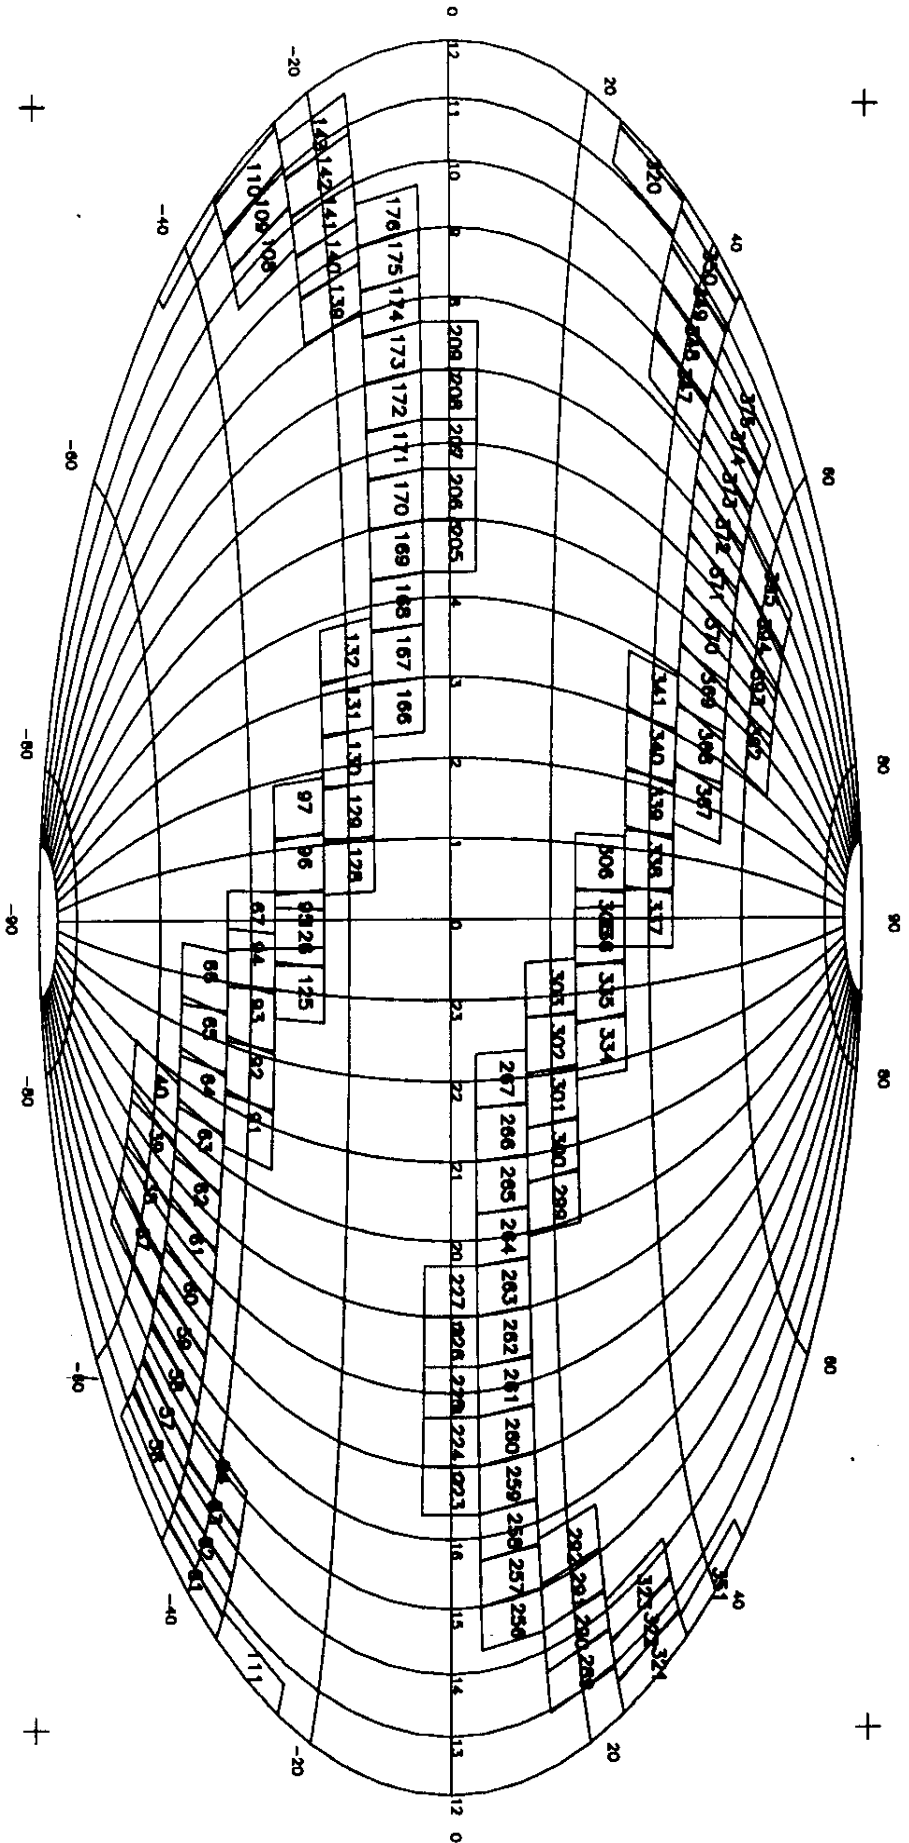

Figure 1. ISSA Fields for $50^\circ > |\beta| > 20^\circ$ in Equatorial Coordinates

Infrared Astronomical Satellite [IRAS] Data Archive and Infrared Processing and Analysis Center [IPAC] Facilities

The Infrared Processing and Analysis Center [IPAC] supports the astronomical community in the use of the IRAS archival data. Investigators visit IPAC to use the raw, intermediate, and released data products associated with the IRAS mission; to gain additional insight into the products through detailed analysis or consultation with the developers and resident scientists; to obtain special data reduction peculiar to their research objectives; and to use the database and/or image analysis tools that IPAC develops and maintains for users. Many investigators now use IPAC's data at their home institutions by connecting remotely over standard networks, but a significant group come to IPAC to learn about and use the new tools and products.

The Infrared Sky Survey Atlas [ISSA] is IPAC's newest product, consisting of a full set of all-sky digital images with 1.5 arcminute pixels. ISSA replaces the original IRAS medium resolution image set [SKYFLUX] incorporating improvements in calibration, pointing, and destripping. In addition, the zodiacal emission has been modelled and removed, and the three different passes over the sky coadded. The net result is that ISSA is up to five times more sensitive to low surface brightness structure than the earlier image data. The processing for the sky above absolute ecliptic latitude 50 degrees is now completed; the remainder of the data will be available in the Summer of 1992. The images are available in FITS format from the National Space Science Data Center [NSSDC]. In addition, IPAC supports extensive image processing and analysis capabilities using its software package SKYVIEW, as well as other image processing packages. IPAC will also support remote interactive query, retrieval, and analysis of its on-line archive of the entire ISSA image set.

In addition to data products, IPAC develops and supports analysis tools for interpretation of IRAS data. The most recent tool is the High Resolution processor [HIRES] which provides images with spatial resolution enhanced by a factor of about four for bright sources (> 1 Jy). Other special request tools include a full resolution two-dimensional coadder [FRESCO] and a one-dimensional coadder [ADDSCAN/SCANPI]. These tools, and other software packages in wide use in the community, are supported at IPAC using SUN/SPARC workstations operating under UNIX with X-windows.

The Faint Source Survey [FSS] (Catalog and Database) is also available. The FSS achieves a one magnitude increase in sensitivity to point sources relative to the IRAS Point Source Catalog [PSC], and is reliable and complete in unconfused sky areas typically to levels of 0.18, 0.21, 0.28, and 1.1 Jy at 12, 25, 60 and 100 microns, respectively. The on-line database contains over 750,000 sources, of which 173,044 have been released in Version 2.0 of the Faint Source Catalog (also available from the NSSDC). IPAC supports database queries to the FSS Catalog and Database and other on-line catalogs, including user-supplied catalogs, employing the IPAC CATSCAN software package and user interface.

Dear Michael,

This memo documents the release strategy for the ISSA fields that cover the sky between -50 to 50 degrees ecliptic latitudes. The release will be in two stages as outlined below.

The set of ISSA images which have centers above |20| degrees ecliptic latitude and with no portion of the image dropping below |13| degree ecliptic latitude are ready for immediate release. The enclosed 8mm tape contains this set of 117 fields. The first tar file contains 468 coadded images. The second and third tar files contain 896 and 888 individual hcons plus coadded images for the southern and northern ecliptic hemispheres, respectively.

Please include the following attached memo when processing a request for an ISSA image from this second released set. Thank you.

The remaining 151 ISSA fields covering the lower ecliptic latitudes between -20 and 20 degrees are affected by emission from the zodiacal bands. Even though the residual zodiacal emission reduced the quality of the lower latitude images as compared to those covering the higher ecliptic latitudes, valuable information is available from these images on scales less than 0.7 degrees (Cobe resolution). This set will be released under separate cover in 1993 and will be considered a separate product since special care must be taken when using them. An explanation of their use will be in the ISSA Explanatory Supplement which will be released at the same time.

IPAC is planning to make and release another CD-ROM set of the ISSA images in 1993. I will be in touch with you once the details have been worked out.

Sincerely,

Sherry Wheelock

Code 933
Greenbelt, MD 20771

Dear Mike:

Enclosed are the three 8mm tapes for the |ecliptic latitude| > 50 degree sky. The contents of each tape are described below:

Tape #	Labelled	Description
1	README/SOFTWARE	This tape has the software and readme text for each cd-rom (see attached). File 1 has data for cd-rom1, File 2 has data for cd-rom2, File 3 has data for cd-rom3, File 4 has data for cd-rom4.
2	ISSA HCON0	Contains a single file of coadded images. These are for cd-rom1.
3	ISSA ALLHCONS	Contains images for cd-roms 2-4. File 1 contains images for cd-rom2, File 2 contains images for cd-rom3, File 3 contains images for cd-rom4,

Cd-rom1 will have the following directory structure:

```

cdrom1  readme          software(dir)      images(dir)
              for(dir)      c(dir)

```

The cdrom1 is an empty file placed on cd-rom1 to assist the user in identifying which cd-rom is being accessed. Cdrom1 and the readme file plus the software/for and software/c directories are all on the first 8mm tape, file 1. The coadded images from the second 8mm tape, ISSA HCON0, are placed under directory 'images.'

Cd-rom2 through cd-rom4 have the following directory structure:

```

cdromx  readme  images(dir)

```

Cdromx, where $x = 2, 3$ or 4 , and the readme files are found in files 2, 3 and 4 on the first 8mm tape. The images that are placed in the images directory are contained in the third 8mm tape, file 1, 2 and 3, respectively.

Please contact me if you have any questions.

Sincerely,

A handwritten signature in cursive script that reads "Sherry Wheelock".

Sherry Wheelock

Sample of Tar Tape

When restoring/reading or writing TAR tape always use the `resize` & `blocksize` parameters on the mount command. This does NOT apply for straight copy.
