

1 specific points to follow. For that condition, can I
2 take a vote for all in favor of condition No. 1.

3 MS. MOYNAHAN: Nine in favor.

4 DR. TRACY: Opposed? Okay. So condition 1
5 is approved.

6 Any additional conditions?

7 DR. WHITE: Can we discuss the follow-up of
8 the paradoxical embolus indication? Add that as well
9 as a post-marketing tool.

10 DR. TRACY : I think that might have been
11 included in the prior discussion regarding the
12 surveillance. I don't think we need a separate motion
13 on that. That is included in the discussion that we
14 had.

15 DR. WHITE: Then also can we discuss as a
16 condition then that we adopt the labeling
17 recommendations that we made, the changes to the
18 labeling>

19 DR. TRACY: Yes. That's fine. Labeling
20 changes. To summarize, the labeling changes that we
21 are proposing. Help.

22 DR. SKORTON: They were in the indications

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 and contraindications and precautions and warnings.

2 DR. WITTES: Table 5.

3 MR. DILLARD: Yes, in Dr. Wittes' Table 5.

4 I didn't hear this specifically but just a question,
5 I think, for the committee. In terms of taking a look
6 at some of the subgroup analyses, which I don't know
7 if Dr. Wittes is going to bring up again, but if we
8 look at some of the extremes, how would be handle that
9 in the labeling and would you have any additional
10 suggestions based on how we would look at the data?
11 That's the only thing I didn't hear specifically about
12 a labeling change.

13 DR. TRACY: Maybe Dr. Wittes can if she's
14 had a chance to do some more calculations on that, but
15 I think that the thing that we don't have data on
16 should be stated what we do and what we don't have
17 data on.

18 That can then leave some discretion in terms
19 of the operator how they want to handle that lack of
20 data without specifically contraindicating the
21 procedure for that type of clinical situation. Any
22 other --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 2344433

www.nealrgross.com

1 DR. WITTES: But, again, I think it's a
2 little more subtle than that. It's that there are
3 data but they are not directly comparable. I think
4 that is the subgroup issue here.

5 I don't know how to answer the question and
6 I don't know what I think. What I feel is that what
7 is presented currently is not sufficient and doesn't
8 reflect what the data show.

9 One of the problems is we don't really know
10 what the data show because we haven't seen the
11 analysis that would say, "Ah ha, this is what the data
12 are showing relevant to specific questions."

13 I guess one of the things I don't understand
14 is if you see a patient, do you say, "This is a five-
15 year-old. Should I make this choice or that choice?"
16 "This is a 10-year-old. Should I make this choice or
17 that choice?" "This is an 18-year-old."

18 I mean, do you as clinicians think about the
19 age of the kid or the adult and make a decision that
20 is pertinent to that age, in which case I think it's
21 very important, the age and the size.

22 DR. WHITE: I think that's a different issue

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

1 than this committee should decide, though. I think
2 we're asked to look at the reasonableness or the
3 probable efficacy and safety. I think we've seen
4 nothing that suggest that it's not reasonable to think
5 that's going to be safe.

6 I think that a clinician might well make
7 those judgements and individual patient interaction.
8 I have seen nothing about the extremes of the device
9 that make me nervous that it's not going to work.

10 DR. WITTES: No, I'm not saying that. But
11 it seems to me we haven't seen the data analyzed in a
12 way that addressed those issues at all. In a clinical
13 trial you really wouldn't worry so much about it.

14 In a situation like this I think the data
15 should be presented. The presentation may just make
16 everybody feel great. This is fine. But in the
17 absence of a good control, I do think that there needs
18 to be more on the label that describes analysis.

19 DR. TRACY : Let me see if I can put this
20 together. One condition is that we would recommend
21 some changes in the labeling that would indicate who
22 has and who has not been studied in this protocol more

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 clearly, the few little changes which you can refer
2 back to the previous discussion regarding the nickel
3 and the anti-coagulation issues, etc. That would be
4 one condition.

5 I do think there is another condition that
6 we will be asking the company to provide additional
7 analysis of their data to the FDA that would take out
8 those upper age ranges that were not really included
9 in the surgical group. I think that is an additional
10 condition that we might come up with. However, I
11 would like to take a vote, if that's all right, on the
12 condition regarding the labeling as we have discussed.

13 DR. SKORTON: I just have one question. I
14 do share some of your concerns but I don't think they
15 should affect the labeling. I don't think they are
16 discrete enough to affect the labeling. I haven't
17 heard you say anything.

18 I'm not convinced, for example, labeling
19 should say this device is not proven to work in
20 younger people or older people. When I'm going to
21 vote on labeling, I'm talking about the precautions,
22 warnings, indications, contraindications. The only

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 indication one that I thought we agreed on changing
2 was the one having to do with the PFO.

3 DR. TRACY: Correct.

4 DR. SKORTON: But we weren't going to have
5 a disclaimer in the indications about the extremes of
6 age. I thought that was the point of doing a post-
7 market study.

8 DR. WITTES: I fully agree with that. All
9 I'm saying is that when the data are presented as a
10 summary, that summary should be expanded, but not to
11 say don't include it.

12 MS. MOYNAHAN: Can we take a vote on the
13 labeling?

14 DR. TRACY: Yes, on the labeling. All those
15 in favor of the condition dealing with labeling that
16 we've just discussed, please indicate so.

17 MS. MOYNAHAN: All right. That's 10 in
18 favor. We do have 10 voting people here. I only
19 counted nine in the last one. Was there anyone that
20 abstained or voted against it that I missed or was
21 everyone's hand up for the surveillance issue? Okay.
22 That was 10 in favor then.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 DR. TRACY: Okay. All right. Then there is
2 nobody that's opposed to that condition. Any
3 additional conditions? Do we want to try to turn the
4 request for additional analysis into a condition? No.
5 That's just simply going to happen. Okay. Any
6 additional conditions? Okay.

7 At this point we need to vote on whether the
8 device is approvable with the conditions as we have
9 already voted on or not. All in favor of approval
10 with the conditions as stated.

11 MS. MOYNAHAN: That's ten in favor. Then we
12 can also go around and each person can state their
13 vote and the reason for it.

14 DR. WHITE: I'm Chris White and I vote for
15 the motion with limitations because I'm convinced that
16 the data that's been presented today is reasonably
17 safe and effective.

18 DR. WILLIAMS: Roberta Williams. I vote yes
19 because I do believe it passes the reasonableness
20 test.

21 DR. SKORTON: I'm David Skorton and I vote
22 yes because I believe it shows reasonable evidence of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1 safety and efficacy.

2 DR. ZAHKA: I'm Kenneth Zahka and I voted
3 yes because I think this will help a number of
4 children and young adults with atrial septal defects.

5 DR. HOPKINS: Dr. Richard Hopkins. I voted
6 yes because I think it does meet safety and efficacy
7 against the arbitrary standard. While the discussion
8 well reflects our concerns about the relative efficacy
9 with other options, that is going to be addressed by
10 the conditions imposed and by clinician judgement.

11 DR. AZIZ: Salim Aziz. I voted yes because
12 I think it does demonstrate safety and efficacy.

13 DR. TRACY: Dr. Laskey.

14 DR. LASKEY: Yes. Warren Laskey. I voted
15 for approval with the conditions much as my colleagues
16 have. I would like to also personally acknowledge the
17 efforts of Dr. Amplatz who is standing in the corner
18 there who made a major, major contribution to
19 interventional cardiology.

20 DR. McDANIEL: Nancy McDaniel. I voted in
21 favor of approval with the condition stated having met
22 the safety and efficacy. Again, it's going to be a

1 great contribution to the care of these patients.

2 DR. WITTES: I votes yes for much the same
3 reason as everybody else did.

4 DR. CRITTENDEN: I voted for approval with
5 conditions for similar reasons. It was safe and
6 relatively effective.

7 DR. TRACY : Any additional comments, Mr.
8 Dacey or Mr. Morton?

9 If not, we will end this portion of today's
10 meeting and break for lunch. We have a vote to come
11 back at 2:15.

12 (Whereupon, at 1:34 p.m. off the record for
13 lunch to reconvene at 2:15 p.m.)

DR. TRACY: I'd like to call to order this meeting of the Circulatory System Device Panel. The topic for discussion this afternoon is a premarket application for NMT Medical CardioSEAL Septal Occlusion System, with Qwikload.

At this point I would like to hold an open public hearing. There were no requests ahead of time but is there anybody here who would care to make a presentation on this or other topics?

Okay. If not, then we will close the open public hearing and move on to the sponsor's presentation.

MR. AHERN Good afternoon. My name is John Ahern. I'm the President and CEO and Chairman of the Board at NMT Medical, a public company and I am a stockholder in that company.

Madam Chairperson, panel members, and FDA representatives, we are pleased to have an opportunity to present data in support of the safety and efficacy of the CardioSEAL Septal Occlusion System device in

NEAL R. GROSS

1 the treatment of complex ventricular septal defects.
2 More common forms of congenital VSDs, which can be
3 readily identified and repaired using standard
4 surgical procedure, are not a subject of this PMA.

5 Clinical data used in support of this PMA
6 were obtained from a ongoing clinical trial sponsored
7 by Children's Hospital, Boston, and provided to us
8 under a licensing agreement.

9 Following my brief introductory remarks our
10 presentation will proceed as follows:

11 We'll have a device description presented by
12 Carol Ryan who is the Vice President of Research and
13 Development of NMT Medical. Followed by discussion of
14 indications by Dr. John Mayer. Dr. Mayer is a Senior
15 Associate in Cardiovascular Surgery at Children's
16 Hospital in Boston, Professor of Surgery, Harvard
17 Medical School.

18 We will then have a discussion of the
19 procedure by Dr. Peter Laussen. Dr. Laussen is Co-
20 Director, Senior Associate in Anesthesia, Children's
21 Hospital, Boston, and Associate Professor of
22 Anesthesia, Harvard Medical School.

(202) 234-4433

www.nealrgross.com

1 Following that we'll have the clinical trial
2 overview by Dr. Kathy Jenkins. Dr. Jenkins is
3 Associate in Cardiology, Children's Hospital, Boston,
4 Assistant Professor Pediatrics, Harvard Medical
5 School.

6 Then we'll lead on to trial results and
7 analysis by Dr. Kimberlee Gauvreau. She is an
8 Associate in Cardiology, Children's Hospital, Boston,
9 Assistant Professor Pediatrics, Harvard Medical
10 School. Also Dr. Gauvreau is the Assistant Professor
11 of Biostatistics at Harvard School of Public Health.

12 Then we'll follow with conclusions by Dr.
13 Jenkins.

14 We've also invited a number of experts who
15 are familiar with either the VSD device in clinical
16 trial or the statistical data, the clinical data
17 involved with that.

18 I would like to introduce Ms. Amy Britt who
19 is the Research Manager of Children's Hospital in
20 Boston, Dr. Mark Boucek who is Medical Director of
21 Pediatric Heart Transplantation, Children's Hospital
22 in Denver, and Professor of Pediatrics at University

1 of Colorado, Hill Sciences.

2 Also Dr. Mark Hoyer. Dr. Hoyer is the
3 Director of Interventional Cardiology, Riley Hospital
4 for Children, Indianapolis, and Clinical Associate
5 Professor of Pediatrics, Indiana University.

6 Finally, Dr. James Lock, Cardiologist-in-
7 Chief, Children's Hospital in Boston, Professor of
8 Pediatrics, Harvard Medical School.

9 They are here today and available to answer
10 any questions as needed.

11 Just a brief marketing history of the
12 CardioSEAL device: The FDA has already approved the
13 device based on its safety data and it's commercially
14 available in the United States under the Humanitarian
15 Device Exemption Regulations for three different HDE
16 approvals, one of which is the same indication
17 proposed by the PMA which was approved by the FDA
18 almost two years ago.

19 The other two HDE indications were for a PFO
20 closure in patients failing medical therapy and also
21 the fenestrated Fontan procedure. The device is also
22 commercially available in the European community,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 Canada, Latin America, and the Pacific Rim.
2 Approximately 10,000 CardioSEAL devices have been
3 . implanted since 1996.

4 I would like to introduce Carol Ryan who
5 will provide data on the device.

6 MS. RYAN: Good afternoon. Again, my name
7 is Carol Ryan. I'm an employee of NMT Medical and a
8 shareholder.

9 The CardioSEAL Septal Occluder is a second
10 generation device which has been designed for
11 percutaneous closure of intracardiac defects. The
12 CardioSEAL implant is comprised of a structural
13 framework and a tissue scaffold.

14 The structural framework is fabricated
15 primarily from MP35n, an alloy which has excellent
16 corrosion resistance and is inherently non-
17 ferromagnetic. MP35n has been used in a variety of
18 implants including pacemaker leads, stents, aneurysm
19 clips, and orthopedic applications.

20 The tissue scaffold is knitted polyester
21 fabric similar to those commonly used for vascular
22 grafts and cardiac patches.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 The implant is available in four sizes
2 ranging from 17 mm to 33 mm. The design is similar to
3 a double umbrella with each umbrella comprised of four
4 MP35n springarms or eight per device.

5 Each springarm has three functional coils
6 per arm. The center coil, which is called the
7 shoulder coil, the elbow joint and the wrist joint.
8 These coils are put there to control functional
9 stresses within the springarm and provide adequate
10 fixation within the heart.

11 A pin is centrally located on the proximal
12 side of the device for attachment to the delivery
13 system. Platinum springs are soldered to the end of
14 each springarm for enhanced radiopacity. The tissue
15 scaffold, a knitted polyester fabric, is attached to
16 the framework using polyester suture.

17 The implant is packaged attached by suture
18 to a disposable loading system called the Qwik Loader.
19 The Qwik Loader is utilized to collapse the umbrella
20 and introduce it into the delivery sheath. The
21 CardioSEAL delivery system is designed to facilitate
22 attachment, loading, delivery, and deployment of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 CardioSEAL through a commercially available 10-French
2 sheath.

3 One-size delivery system is compatible with
4 the entire family of CardioSEAL implants. This
5 particular version of the delivery system is a third-
6 generation design with improvements and ease of use
7 over prior generations.

8 The system is comprised of a control handle,
9 a catheter shaft of pushing the implant through the
10 sheath., a spring guide with a sleeve on the distal end
11 for capturing the implant pin wire and the delivery
12 system pin wire.

13 This video depicts the attachment and
14 loading of the CardioSEAL implant. First the pin wire
15 of the delivery system is advanced from the sleeve at
16 the distal end of the spring guide. The implant pin
17 is now placed within that sleeve and the two pins are
18 locked in place.

19 The implant is then collapsed within the
20 Qwik Loader. The occluder disc, which is a packaging
21 aid, is disposed of. You can see the implant being
22 pulled into the clear part of the Qwik Loader.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 The catheter shaft is advanced to be
2 adjacent to the implant. A Touhy-Borst is attached
3 which will be used for flushing the system to remove
4 air bubbles. Several of the loader components are now
5 disposed of.

6 The suture is being removed there. The
7 system is thorough flushed to remove air bubbles.
8 This is easily visualized through the clear tube.
9 Then the Qwik Loader is placed into a 10-French sheath
10 in place across the defect.

11 Critical design features of the CardioSEAL
12 implant include a design focused on long-term
13 biocompatibility including a well-characterized tissue
14 scaffold which promotes fast and thorough
15 encapsulation. This photo of a sheep explant at 90
16 days demonstrates the complete endothelial coverage of
17 the implant.

18 The spring arms are where the laser is
19 pointing. This is the edges of the device. There is
20 complete endothelial coverage of both the fabric and
21 the spring arms including the device septum interface.
22 The metallic framework has excellent corrosion

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

(202) 234-4433

www.nealrgross.com

1 resistance and a low medial surface area to minimize
2 leeching and it is MRI compatible.

3 The double-umbrella design gives the implant
4 the ability to conform to variable anatomy and a low
5 profile in the septum following implantation to
6 minimize hemodynamic disturbances.

7 Now, I would like to introduce the next
8 speaker, Dr. John Mayer of Boston Children's Hospital
9 and Harvard Medical School. Dr. Mayer will speak on
10 the INDICATIONS FOR USE of the CardioSEAL.

11 DR. MAYER: I have no interest in this
12 company and have only been paid for travel and an
13 honorarium. I am here to speak with you for, if you
14 will, the surgeon's perspective about this device and
15 its utilization. Hopefully I go in the right
16 direction on the slides. And I didn't.

17 I apologize to my pediatric cardiology and
18 cardiac surgery colleagues who are on the panel, but
19 for the other members I would like to review a little
20 bit about what the anatomy is that we're talking
21 about.

22 Defects in the ventricular septum can occur

1 in a variety of locations, the most common one being
2 here in what we call conoventricular or perimembranous
3 area, but they can exist in any point in the right
4 ventricle. This view is as though the interior wall
5 of the right ventricle has been removed and one is
6 then looking at the septum.

7 The defects in particular that we are
8 talking about as applications for this device are
9 those down here in the apical muscular area where
10 there is a lot*of trabeculation in the right ventricle
11 that can cover the right ventricular side of the
12 defect and primarily those also in the anterior
13 muscular area. We'll go into that in more detail.

14 This slide is simply to just give you an
15 idea about the occurrence of these various sorts of
16 defects in these locations. This is based on a review
17 of a large number of cases over a 15-year period at
18 children's hospital in Boston.

19 You can see the perimembranous VSDs are, in
20 fact, far and away the most common defects, but there
21 are a significant number of patients who have both
22 muscular and multiple ventricular septal defects.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 This is actually from a series from the
2 University of Alabama in Birmingham and the only
3 reason for showing all of this data is to point out
4 that, in particular, if one looks at risk factors for
5 mortality after surgical ventricular septal defect
6 closure, the presence of multiple ventricular septal
7 defects, particularly when they are in that
8 trabeculated area of the ventricular septum, are the
9 ones that are associated with the highest mortality,
10 at least in that series.

11 And this is just an angiogram demonstrating
12 the types of defects that we're talking about. You
13 can see, in fact, here there are multiple holes, one
14 in the perimembranous area but two down here in this
15 more heavily trabeculated area of the right ventricle.
16 These are, in fact, the defects that we're proposing
17 and have gained experience with for device closure.

18 So one of the questions that clearly is
19 germane to thjs issue is what would be a high-risk or
20 complex VSD and I will provide you with my own
21 viewpoint of that. There are two major criteria.

22 One is that the typical surgical approaches

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 would compromise ventricular function and, in
2 particular, the use of left ventriculotomy. I'll show
3 you some pictures of how that works from the surgical
4 perspective.

5 Or a very extensive right ventriculotomy
6 which might be necessary to close multiple holes. Or
7 that there is a high probability of there being a
8 significant hemodynamically significant residual
9 ventricular septal defect.

10 Some, cases in which that can occur are in
11 patients who have failed a 'previous VSD closure, in
12 those patients who have multiple apical or anterior
13 muscular VSDs. A terminology has been used sometimes
14 that this is a so-called Swiss cheese septum, multiple
15 holes. And certain isolated posterior apical
16 ventricular septal defects which are covered by the
17 trabeculations as we showed in the previous slides.

18 I think certainly when I came to Boston a
19 left ventricular approach was a standard approach to
20 defects in 'this heavily trabeculated part of the
21 septum. This is just an artist depiction of how this
22 operation is performed so that one actually makes an

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 incision in the left ventricle.

2 The reason for doing this is because in many
3 cases these defects are single and actually relatively
4 easily identified from a left ventricular aspect, but
5 from the right ventricular aspect they are much more
6 difficult because of all of the crossing
7 trabeculations. One can simply through this left
8 ventriculotomy sew a patch in to occlude the defect.

9 When we looked, however, in the late 1980s
10 at a group of patients who had undergone an apical
11 left ventriculotomy for defects in this area, what we
12 found is that fully half of the patients who had
13 undergone that approach had a significant residua as
14 a consequence of this approach.

15 Despite the fact that many times this seemed
16 as though it was easy to close, there were a
17 significant number of patients who had residual
18 ventricular septal defects.

19 We had three patients or three episodes
20 where an aneurysm formed at the site of the left
21 ventriculotomy. A significant number of the patients
22 had clinically significant left ventricular

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

(202) 234433

www.nealrgross.com

1 dysfunction after this approach. Actually two of the
2 patients either went on to die or had to be
3 transplanted.

4 Now, as I think was already alluded to, this
5 device is not being proposed to be used to close every
6 hole in the ventricular septum. Certainly we have
7 evolved as an institution to take the following
8 approaches, and that is that defects that are close to
9 the atrial ventricular valve leaflets or the chordae
10 or defects that are close to the semilunar valves are
11 ones that we have not employed this device to use
12 clinically.

13 To remind you again, we are not talking
14 about defects that are easily accessible from a
15 surgical perspective, those in this so-called
16 subpulmonary area, the perimembranous area, because of
17 their proximities to the either semilunar or atrial
18 ventricular valves.

19 Defects in what we would call the inlet
20 septum or AV canal type of defect are not ones that we
21 would propose to use the device for. We are really
22 talking about defects down here in this heavily

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 trabeculated part of the septum.

2 So, in summary, we would use conventional
3 surgery for the conoventricular VSDs so that includes
4 perimembranous VSDs now align the defects as occur in
5 tetralogy. Inlet VSDs, we have used surgical approach
6 for single large high anterior muscular VSDs and
7 certainly those for the outlet VSDs.

8 Our current approach is, however, to use a
9 transcatheter approach for multiple apical and
10 anterior VSDs and posterior apical VSDs covered by
11 trabeculations. We have utilized the device in
12 certain post-repair residual VSDs.

13 Thank you. I'm going to introduce to you
14 Dr. Peter Laussen from our cardiac anesthesia group who
15 is going to describe the procedure.

16 DR. LAUSSEN: Good afternoon, ladies and
17 gentlemen. My name is Peter Laussen. I'm Co-Director
18 of the Cardiac Anesthesia Service at Children's
19 Hospital and Associate Director of the Cardiac
20 Intensive Care Unit.

21 I have no financial relationship with NMT
22 Medical. They are covering my expenses for this

1 presentation, however.

2 My presentation goals are to describe the
3 technique initially with an animated video and some
4 angiographic still frames. But as way of
5 introduction, I think it's important to emphasize that
6 in contrast to our experience with ASD and PDA device
7 deployment, there may be hemodynamic events that occur
8 during the placement of a VSD device across a complex
9 VSD.

10 However, with appropriate anticipation and
11 collaboration between our staff and the
12 catheterization laboratory, patients are safety
13 managed during this intervention.

14 Let me first start with the video produced
15 by NMT.

16 (Whereupon, there was a videopresentation.)

17 DR. LAUSSEN: Next I would like to show a
18 number of still antiographic frames that highlight
19 aspects of this procedure because it's germane to
20 discussion about adverse hemodynamic events.

21 In this particular still frame a petal
22 catheter has been placed within the left ventricle and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 on left ventricular angiography the muscular VSD is
2 demonstrated.

3 As also shown in the video, this still frame
4 demonstrates the antegrade passage (trans-atrial
5 septal) of an end hole balloon tip catheter from the
6 left ventricle across the VSD into the right
7 ventricle. It is generally easier to cross the VSD
8 from within the left ventricle because of the
9 trabeculations on the right ventricular septal
10 surface.

11 This slide demonstrates the transvenous-
12 transcardiac guidewire pathway. In this circumstance
13 wire has been delivered through the femoral vein
14 *infera vena cava* transeptally across the mitral valve
15 to the left ventricle across the VSD into the right
16 side of the circulation where it is being snipped and
17 removed from an alternavenous access site which, in
18 this case, is the internal jugular vein.

19 The importance of this is that undue
20 pressure applied to this wire may directly injure the
21 myocardium and cause acute atrial ventricular vulvar
22 regurgitation. It is the passage of this wire and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 2344433

www.nealrgross.com

1 subsequent large sheaths that may result in homonymic
2 adverse events during the procedure.

3 It is easier rather than to leave a large
4 11-French sheath within the atrial system in the
5 femoral artery and across the aortic valve, generally
6 the VSD is crossed from the right ventricular side
7 with a large 11-French sheath which in this
8 circumstance has been passed from the internal jugular
9 vein down across the VSD crossing from the right
10 ventricle to the left ventricle.

11 The CardioSEAL delivery system is delivered
12 through the sheath. The distal arms are open within
13 the left ventricle and the device is then removed back
14 against the left ventricular side of the septum and
15 then across the septum for deployment of the proximal
16 arms. Also the transesophageal echo probe which is
17 used to assist with deployment of the VSD device
18 across the septum.

19 Following deployment of the device, the
20 device is detached from the delivery system and an LV
21 angiogram is performed to demonstrate appropriate
22 position.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealgross.com

1 The reason for going through these
2 angiographic slides is to highlight the transvenous-
3 transcatheter pathway of the guidewires and sheaths
4 because the hemodynamic adverse events that may occur
5 during this procedure are primarily related to the
6 technique.

7 Early in our experience we evaluated
8 patients undergoing this procedure, the hemodynamic
9 and potential cardiac complications during this
10 procedure and determined that the complications and
11 adverse events were independent of the patient's
12 diagnosis or indication for device deployment
13 independent of the pre-catheterization clinical status
14 as assessed by ASA classification and independent of
15 patient size.

16 However, acute resuscitation may be
17 necessary during the procedure despite the events are
18 readily treatable and reversible. Hemodynamic
19 instability, therefore, may relate to hypovolemia
20 which primarily relates to frequent catheter changes
21 through large sheaths because of arrhythmias which may
22 be ventricular, supraventricular, and cardiac output

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 which commonly reflects acute vulvar insufficiency
2 during the procedure and, in rare circumstances,
3 cardiac arrest may occur.

4 However, with appropriate treatment with
5 blood volume replacement, the use of inotropic,
6 chronotropic and vasopressor agents, the occasional
7 use of temporary trans-venous pacing and
8 cardioversion, these complications are readily
9 reversible.

10 Our strategies for management, therefore,
11 include general anesthesia for all cases because of
12 the risk for adverse events. Also because we share
13 the airway with the echocardiographer during TEE and
14 for vascular access issues.

15 Resuscitation drugs and equipment should be
16 prepared and immediately available for every case, and
17 we have ICU backup for every case.

18 In conclusion, the transcatheter device
19 occlusion of a complex VSD is a challenging
20 environment and a challenging intervention with
21 potential for adverse effects. However, with
22 appropriate anticipation, patients are safely managed

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1 through this procedure.

2
3 Thank you. Next I would like Dr. Jenkins to
4 come and talk regarding the clinical trial overview.

5 DR. JENKINS: My name is Kathy Jenkins. I
6 have no financial interest in NMT Medical, Inc. I
7 paid for my expenses to attend the session today.

8 What I would like to do now is to show you
9 this source of the information that was presented to
10 you in the Panel Packet and was presented for this PMA
11 application.

12 There were five separate cohorts of
13 information presented for the PMA application. These
14 five cohorts were derived from two separate studies.
15 The first cohort, and by far and away the most
16 important, which is referred to as the pivotal cohort,
17 includes patients undergoing ventricular septal defect
18 closure using the CardioSEAL device as part of a study
19 that I'll describe in detail known as the High Risk
20 study. This information includes detailed information
21 about device safety and efficacy.

22 In addition, there are four additional non-

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

1 pivotal cohorts. The one that we will describe in
2 some detail includes patients that underwent closure
3 of a ventricular septal defect using a prior
4 generation of the device known as the Clamshell I.

5 All of the data from both studies used for
6 indications other than VSDs are also presented as well
7 as information in a , small number of prospective
8 patients where the device was used to close post-
9 infarction ventricular septal defects, although the
10 focus of all of the non-pivotal cohorts is primarily
11 to provide additional information about device safety
12 as well as longer term follow-up.

13 As I mentioned previously, the pivotal
14 cohort was derived from a study known as the
15 CardioSEAL High Risk Study. This is a prospective
16 multi-center study that began enrollment in 1996 for
17 which the Children's Hospital in Boston is the study
18 sponsor.

19 This study is overseen by a safety and data
20 monitoring committee chaired by Dr. Thomas Haugen and
21 is currently ongoing. Enrollment in the study through
22 2/1/00 was submitted as part of the PMA application.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 2344433

www.nealgross.com

1 As I mentioned previously, this study
2 includes patients with ventricular septal defects as
3 well as other types of cardiac defects. The safety
4 data from this study were used to support HDE
5 approvals for fenestrated Fontan closure, ventricle
6 septal defect closure, and PFO closure in recurrent
7 stroke patients.

8 The design of the CardioSEAL High Risk Study
9 was to determine the safety and efficacy of the
10 CardioSEAL device in patients with limited acceptable
11 alternatives. The study is a prospective cohort of
12 implants patients without a concurrent control group.

13 However, patients were entered into the
14 study by an independent peer review process whereby an
15 uninvolved, meaning uninvolved with the patient or the
16 study, cardiologist and cardiac surgeon were required
17 to approve the enrollment of patients in the trial.

18 The criteria that were used by peer review
19 team to make the device determinations are shown on
20 this slide. The peer review team had to ascertain
21 that the patient had one or more cardiac defects of
22 sufficient hemodynamic derangement to warrant

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

-1 intervention and that the patient had either a type of
2 defect that is technically difficult or impossible to
3 close surgically, or an overall medical condition such
4 that the surgical risks were sufficient to justify the
5 known and potential unknown risks of the device.

6 The outcome evaluation was performed
7 prospectively on an ongoing basis at baseline,
8 discharge, 1, 6, 12, and 24 months following the
9 procedure and included a clinical evaluation, chest x-
10 ray, echocardiogram, and a fluoroscopy at 6 and 24
11 months after implantation.

12 A core laboratory was responsible for the
13 final interpretation of all chest x-rays and
14 echocardiograms in this study.

15 The efficacy assessments for patients
16 enrolled in this trial was performed in three
17 different ways that I will describe in detail. The
18 first, which we call Clinical Status, by Lesion, uses
19 a combination of information from two ordinal scales.
20 The second Clinical Status by Patient, uses a
21 combination of information from 8 scales. The third,
22 Echo Closure Status, is defined more traditionally

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 2000.53701

(202) 234-4433

www.nealrgross.com

1 categorically.

2 In all cases these efficacy assessments were
3 evaluated as a change from a patient's preimplantation
4 baseline to the six-month follow-up time point such
5 that each patient served as his or her own control for
6 this assessment.

7 The assessments include a degree of flow by
8 echocardiography as well as other clinical
9 information. As I mentioned previously, all
10 echocardiograms were assessed by an independent core
11 laboratory.

12 To apply the Clinical Status Scale, by
13 Lesion Assessment, a scale value was assigned to the
14 patient at each of the assessment time points using
15 one of two applicable scales. Either an anatomically
16 based scale, or a physiologically based scale.

17 The use of two parallel but equivalent
18 scales allow longitudinal assessment of patients
19 despite interim surgeries such as removal of a
20 previously placed pulmonary artery band. A change by
21 one category in the scale assessments is considered to
22 be clinically meaningful.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 This slide shows the actual scales that were
2 used to make this assessment. I should mention that
3 the point of this overall efficacy assessment was to
4 determine the change i.n the patient's status that was
5 specifically related to closure of the ventricular
6 septal defect.

7 All patients for whom the hemodynamic
8 consequences of the ventricular septal defect were a
9 left-to-right shunt were made by assigning the patient
10 a value of zero to five on this physiologically based
11 scale.

12 Since quite a number of patients in this
13 study have had prior placement of a pulmonary artery
14 band, we created an anatomical but intended to be
15 equivalent scale for those patients in whom the VSD no
16 longer resulted in the left-to-right shunt. This
17 assessment was based primarily on the actual diameter
18 of the ventricle septal defect in relation to the
19 aortic annulus diameter.

20 Patients who died or had the device
21 explanted were categorized as -1 regardless of whether
22 the death or the explant was due to the device or the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 procedure.

2 So as an example, if a patient had a
3 congenital muscular ventricular septal defect and had
4 undergone prior placement of a pulmonary artery band,
5 and then was enrolled in the study and had a VSD
6 closed with the device, and then subsequently had the
7 band removed two months later, the patient would have
8 been assessed on the Anatomical Scale for the three
9 assessments that were made prior to the band removal
10 and on the physiologically based scale after the band
11 had been successfully removed.

12 Two, go one step further and evaluate
13 changes in the patient's status that went beyond the
14 simple consequences of closure of the VSD. We also
15 looked at efficacy using a Clinical Status Scale by
16 patient.

17 This assessment 'was also made as a change
18 from the patient's pre-implantation baseline at the
19 six-month follow-up time point, but now included a
20 status assessment based not only on the VSD but also
21 on other clinical factors and, therefore, is a more
22 global assessment of patient improvement or decline.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 2344433

www.nealrgross.com

1 This slide shows the additional information
2 that was included in this assessment. There's a total
3 of eight scale that were used. The first right to
4 left shunt was rarely applied to this population. The
5 second two are the VSD scales I described previously.

6 In addition, patients were assessed as to
7 their risk for systemic emboli, on hemodynamic
8 compromise not due to shunt most usually either
9 ventricular dysfunction or AV valve regurgitation, the
10 presence of arrhythmia, elevated pulmonary vascular
11 resistance, or additional medical illnesses.

12 This slide shows the possible assessments
13 for the arrhythmia category, again where patients
14 would be given a scale assignment according to the
15 type of arrhythmias that they had at that time point.

16 So in each case a scale value was assigned
17 to the patient in each of the eight categories but the
18 overall assignment for the patient was the lowest
19 value in any of the applicable categories.

20 To clarify with an example, if there was a
21 patient with a medical illness of sufficient severity
22 to be rated as a Category 2 as well as a ventricular

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 septal defect of sufficient severity to be rated as a
2 Category 2, if this patient then underwent successful
3 device closure such that the VSD categorization
4 improved to a four but with no change in the medical
5 condition, the patient would have been assigned a
6 score of 2 at baseline based on the presence of both
7 the VSD and the medical condition, but again would
8 have received a score of 2 post-procedure based on the
9 condition only.

10 The difference in the patient, therefore,
11 would be rated as zero and the procedure would not
12 have been considered successful on the clinical status
13 by patient assignment. The same patient evaluated
14 using the Clinical Status, by Lesion assignment would
15 have improved by two categories and the procedure
16 would be considered a success under that efficacy
17 criteria.

18 We also used the much more traditional
19 measure of efficacy for device trials., namely Echo
20 Closure Status whereby residual flow was categorized
21 as trivial to absent, small or more than small
22 according to strict criteria used by the core

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234433

www.nealrgross.com

1 laboratory.

2 To assess safety for this group of patients,
3 the safety assessment is primarily descriptive but did
4 include a comprehensive definition of adverse events
5 very similar to the definitions used in drug studies
6 whereby all adverse events occurring at any point
7 during follow-up in all patients in whom an implant
a was attempted were recorded.

9 Each of the events then underwent an
10 independent assessment by the safety and data
11 monitoring committee who was responsible for the final
12 attributability and seriousness classifications.

13 The committee graded events as serious,
14 moderately serious, or not serious using strict
15 definitions that were shown in your protocol. And
16 also categorized events as definitely, probably, or
17 possibly related to initial device positioning, to
18 device fraction, otherwise to the device specifically
19 to the implantation part of the cath procedure or
20 otherwise to the catheterization as well as using a
21 variety of unrelated categories.

22 It's important to understand that the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 committee used the possibly related category for these
2 assignments very similar to the way that category is
3 used in drug studies where the possibly related
4 category was intended to mean plausibly related where
5 the committee used probably or definitely related for
6 events that they thought were likely to have been
7 attributed to the device of the implant or whatever.

8 The primary measure of safety that we
9 defined for this study was the proportion of patients
10 with at least one moderately serious or serious device
11 or implantation related event as assigned by the
12 committee.

13 I would now like to switch and describe for
14 you the second source of data that was presented as
15 part of the PMA implication. This data comes from a
16 different study that is known as the Clamshell I
17 Follow-Up Study and is part of the non-pivotal part of
18 the submission.

19 This particular data is a registry of all
20 patients that were implanted with Clamshell devices at
21 the Children's Hospital during prior regulatory
22 trials. The database was retrospectively created in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 1994 and since that time patients have been following
2 prospectively to screen for a device related and other
3 major clinical events.

4 T h i s study also includes patients with
5 ventricle ~~septal defects~~ as well as other types of
6 cardiac defects. These data are included primarily
7 for ascertainment of late device related events.

8 In this study the information is solicited
9 from all patients who consented to participate
10 according to a recommended follow-up schedule. It's
11 in the form of, a registry so the 'testing was
12 recommended but not required but included annual
13 evaluation for the first five years after implant and
14 less frequently thereafter.

15 Adverse events are classified similarly to
16 the CardioSEAL High Risk Study but were not reviewed
17 by an independent safety and data monitoring
18 committee. In the more recent prospective portion was
19 included identification of device in fracture related
20 events only.

21 An Echo Closure Status is also categorized
22 similarly in the prior study but, once again, the Echo

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealgross.com

1 Closure Status for this cohort has not been reviewed
2 by an independent core laboratory.

3 I would now like to introduce you to Dr. Kim
4 Gauvreau who is the biostatistician for both of these
5 studies and she'll talk about the' sample size
6 assumptions as well as review and show the actual data
7 from the study.

8 DR . GAUVREAU: MY name is Kimberlee
9 Gauvreau. I'm a biostatistician at Children's
10 Hospital in Boston. I have no financial interest in
11 NMT although they did reimburse me for my travel
12 expenses today.

13 My portion of this presentation will focus
14 on three things. I will first give a brief
15 description of our sample size calculations. I will
16 then summarize the efficacy and safety results from
17 the VSD pivotal cohort which is part of the CardioSEAL
18 High Risk Study. Finally, I'll present some efficacy
19 and safety results from the VSD non-pivotal cohort
20 that is part of the Clamshell I registry.

21 Beginningwiththe sample size calculations,
22 for efficacy we wanted to have a sample size that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealgross.com

1 would be sufficient to detect a median improvement of
2 two categories from baseline to the six-month follow-
3 up time point on the Clinical Status Scale by lesion.

4 For example, we would want to be able to
5 detect an improvement from category one, heart failure
6 symptomatic to category three which represents a
7 moderate shunt.

8 Since the data are measured on an ordinal
9 scale and are paired each subject serving as his 'or
10 her own control, we use the nonperimetric Wilcoxon
11 signed-rank test to evaluate the null hypothesis of no
12 improvement.

13 In order to achieve 90 percent power, we
14 found that we would need a sample size of 35 patients.
15 Given full information on our VSD pivotal cohort of 57
16 patients, we would have 99 percent power to detect a
17 two category change.

18 Our safety analysis was primarily
19 descriptive and here we wanted to be able to construct
20 a 95 percent confidence interval for the primary
21 safety outcome which is the proportion of patients
22 experiencing moderately serious or serious device or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealgross.com

1 implantation related events with a specified degree of
2 precision.

3 Using the normal approximation to the
4 binomial distribution, we estimated that our sample of
5 57 patients in the VSD pivotal cohort would allow us
6 to estimate a confidence interval with length of plus
7 or minus 13 percent.

8 I'll now summarize the results from the VSD
9 pivotal cohort. There were a total of 74 patients
10 with a VSD enrolled in the CardioSEAL High Risk Study
11 through February 1, 2000. Implant of a CardioSEAL
12 device was attempted in 58 of these patients and
13 successfully placed in 57. There were six patients
14 who had multiple procedures and 26 who had more than
15 one device placed. A total of 107 CardioSEAL devices
16 were implanted.

17 The CardioSEAL device was not implanted in
18 17 patients. In 13 patients device implant was not
19 attempted in most cases because the defect was smaller
20 than anticipated. In one patient the implant was
21 attempted but a device was not placed due to
22 unfavorable anatomy.

1 Because the STARFlex device became available
2 in the late phases of this study before February 2000,
3 three patients with a VSD actually received a STARFlex
4 device rather than a CardioSEAL device. These three
5 patients are not included in any of our subsequent
6 analyses.

7 For the 57 patients who actually received
8 the CardioSEAL device, 46 percent had a congenital
9 defect and 54 percent had a post-operative residual
10 defect. Approximately, 80 percent of the group were
11 less than 10 years of age.

12 The cohort as a whole was quite sick.
13 Eighteen percent had significant arrhythmia, 35 percent
14 elevated pulmonary vascular resistance, 25 percent
15 significant medical illness, and 60 percent
16 significant hemodynamic impairment not due to shunt.
17 Seventeen patients had prior placement of a pulmonary
18 artery band which was later removed in 16 patients.
19 Approximately 83 percent of the 107 implanted devices
20 were either size 17 mm or size 23 mm.

21 Just to remind you, we have three efficacy
22 outcomes, Clinical Status Scale, by Lesion; Clinical

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 Status Scale, by Patient; and Echo Closure Status.
2 I'll begin by looking at the Clinical Status Scale, by
3 Lesion for the VSD pivotal cohort.

4 What you see in the top histogram are the
5 values on this Clinical Status Scale prior to device
6 implantation. Below that are the values of the six-
7 month follow-up time point. You can see that the
8 distribution shifts to the right indicating an
9 improvement on this Clinical Status Scale.

10 There are six patients who have the value -1
11 at the six-month follow-up time point. These are the
12 patients who either died or had their device explanted
13 before the six-month follow-up. They were each
14 assigned the value -1 on this scale regardless of
15 whether their death or explant was due to the device
16 or the procedure.

17 Note that the most common value that occurs
18 prior to implantation or the mode of the distribution
19 is the value 1 which represents heart failure
20 symptomatic, while the value that occurs most
21 frequently at the six-month follow-up is 5 which
22 represents trivial or no shunt.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 Fifty patients were measured on the Clinical
2 Status Scale, by Lesion by prior to implantation and
3 47 at the six-month follow-up. There were 44 patients
4 who had measures at both time points. These 44
5 patients had a median improvement of two categories on
6 this scale. This improvement was statistically
7 significant at the .0001 level.

8 Here you can see the changes in the Clinical
9 Status Scale for the 44 patients measured at both time
10 points. The positive changes from one to four
11 represent improvements in clinical status on this
12 scale.

13 The one patient with a value of zero did not
14 change scale value prior to implantation to the six-
15 month follow-up. The patients with negative values,
16 the negative change all decreased on this scale.
17 These include the patients who died or explanted
18 before the six-month time point.

19 Defining a successful procedure as one in
20 which Clinical Status Scale improved by one or more
21 categories by the six-month follow-up, 84 percent of
22 these procedures were successful.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 2344433

www.nealrgross.com

1 I'm going to now turn to the Clinical Status
2 Scale, by Patient which is a more global assessment of
3 a patient's health status. Here again you can see the
4 distribution of values prior to implementation and at
5 the six-month follow-up time point. Once again, the
6 distribution has shifted to the right suggesting an
7 improvement in clinical status.

8 Here there were 53 patients who could be
9 assessed on the Clinical Status Scale, by Patient at
10 both time points. Again we saw a median improvement
11 of two categories. Not only was this a clinically
12 important improvement for the patients, it was also
13 statistically significant.

14 These are the changes in Clinical Status
15 Scale for the 53 patients who were measured at both
16 time points. Again, a positive change represents a
17 successful procedure. Here 72 percent of the
18 procedures were successful by the six-month time
19 point.

20 Our final measure of efficacy for the VSD
21 pivotal cohort is Echo Closure Status. Prior to
22 implementation 94 percent of the patients had a more

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 than small residual flow represented by Category 3.
2 At the six-month follow-up time point only 9 percent
3 of the patients had more than small flow.

4 This median decrease in the scale value from
5 3 to 2 is statistically significant or, in other
6 words, for more than small residual flow to a median
7 of small residual flow.

8 Summarizing the efficacy data for the VSD
9 pivotal cohort there were successful defect closure
10 and shunt reduction in 84 percent of patients by six
11 months after device implantation.

12 Improved clinical status was observed in 72
13 percent of patients. While there was more than small
14 residual flow in 94 percent of patients prior to
15 implantation, only 9 percent had more than small flow
16 at the six-month follow-up.

17 I'll now look at safety for the VSD pivotal
18 cohort. Using the comprehensive definition of adverse
19 events that was described earlier, 57 out of 58
20 patients with the device implant attempted experienced
21 at least one adverse event through the most recent
22 follow-up.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 There were a total of 222 events. 32 of
2 these were related to the device and include events
3 which were definitely, probably, and also possibly
4 related to the device. 35 events were related to the
5 implementation procedure, 85 to the catheterization,
6 and 70 were unrelated to the device implantation or
7 the catheterization.

8 Our primary safety outcome was the
9 proportion of patients with at least one serious or
10 moderately serious device or implementation related
11 event. 22 patients were found to have an event of
12 this type which represents 38 percent of the VSD
13 pivotal cohort. Again, we are including events that
14 are definitely, probably, or possibly related to the
15 device or procedure.

16 Here we can see of the moderately serious or
17 serious device or implantation related events there
18 were 16 device related events, 12 of which were
19 detected within two days of the implementation
20 procedure. Of the 17 moderately serious or serious
21 implementation related events, 16 were detected within
22 two days of the procedure.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 I would like to take a moment to point out
2 that there is an error in the data in the Panel
3 Package which affects mainly Tables B7 and B9 in
4 Section 5.D. If you look at those tables, we actually
5 have one implantation related event in the one to six-
6 month time frame and a second implantation related
7 event in the greater than six month time frame. Both
8 of those late events were mitral vulvar
9 regurgitations.

10 What we discovered was that there was
11 actually one patient who had ongoing mitral vulvar
12 regurgitation. That patient we mistakenly recorded
13 multiple events for that one patient. It really
14 should have been just a single event.

15 Looking more specifically at the moderately
16 serious or serious device related events, those that
17 occurred within two days of the implantation procedure
18 included four device embolizations. All four
19 embolizations occurred in a single patient who is 70
20 years of age diagnosed with tetralogy of flow and had
21 an AICD.

22 There was one device malposition which was

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 repositioned at the time of a planned surgery. There
2 was one mitral vulvar regurgitation where the valve
3 was stretched at procedure.

4 There was also one perforation of the heart
5 which was detected between two days and one month
6 after the implantation. That was an incidental
7 finding at a planned surgery. There was one vessel
8 dissection that occurred between one and six months
9 after the implantation. That took place during device
10 removal at a subsequent catheterization.

11 One more thing I would like to point out is
12 that the events listed in white are either definitely
13 or probably related to the device and those in yellow
14 are only possibly related to the device.

15 Looking at the moderately serious or serious
16 implantation related events, the events occurring are
17 being detected within two days of the implantation
18 procedure included five cases of third-degree heart
19 block. Four of these cases resolved within one week
20 of the procedure. The fifth case I will discuss in a
21 minute.

22 There were three cases of ventricular

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 2344433

www.nealrgross.com

1 tachycardia two of which resolved with lidocaine and
2 cardioversion. The third case was that same patient
3 that we will come back to in a minute when we talk
4 about the deaths.

5 There were two hypertensions requiring
6 intervention. There was one event that was detected
7 late, more than two days after the implementation
8 procedure and what an aortic vulvar regurgitation.

9 Most moderately serious or serious device
10 and implantation related events resolved as noted in
11 the previous slides. However, there were ongoing
12 device or implant related event present in two out of
13 58 patients or 3.4 percent.

14 These were mild to moderate mitral vulvar
15 regurgitation. in one patient in mild to moderate
16 aortic vulvar regurgitation in a second patient.

17 Device related events which were categorized
18 as not serious by the safety and data monitoring
19 committee including five device malphysicians, one
20 device delivery system malfunction where there was a
21 difficult release but it was ultimately successful,
22 one kink in the delivery system or sheath.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 There were four deaths in the VSD pivotal
2 cohort and these deaths are described in detail in the
3 Panel Package Section 5.D.1.2. Only one death was
4 considered to be due to the catheterization procedure.
5 This was in a three-and-a-half-month-old child with
6 single ventricle misdiagnosed as Swiss cheese septum.

7 The patient has severe congestive heart
8 failure, low output, and complete heart block after
9 cath and died of multisystem organ failure at
10 attempted PAB and pacemaker placement:

11 There were two additional death that were
12 due to the underlying cardiac disease and one that was
13 due to the underlying noncardiac medical condition.

14 There were four device explants. Again.
15 these are described in more depth in your Panel
16 Package. Two were at heart transplantation, one at a
17 Fontan surgery after a failed septation, and one at
18 catheterization due to device instability.

19 There were 17 device arm fractures among the
20 107 implanted devices. This represents 16 percent of
21 the devices. No adverse events were attributed to
22 device arm fractures in this VSD pivotal cohort.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

1 We next looked at the VSD non-pivotal cohort
2 which was part of the Clamshell I registry mainly to
3 evaluate the long-term safety issues associated with
4 device placement.

5 There were 87 patients in this cohort who
6 received the device. There were a total of 140
7 devices implanted. In this cohort the median follow-
8 up was 4.6 years and the maximum was 11.5 years.

9 There were a total of 25 device related
10 adverse events, 10 of which were serious, eight
11 moderately serious, six not serious, and one of
12 unknown seriousness.

13 Looking at the 18 serious or moderately
14 serious device related events, eight were detected
15 within one week of the implantation and included two
16 device embolizations, one device malposition, and one
17 new onset vulvar regurgitation. The events were quite
18 similar to those noted in the VSD pivotal cohort from
19 the CardioSEAL High Risk Study.

20 All events detected within one week to six
21 months of the implantation procedure were only
22 possibly related to the device. There were two device

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 malposition detected between one and two years after
2 the implantation.

3 The efficacy data available for this cohort
4 was echo closure status at the most recent follow-up.
5 You can see that 82 percent of patients had either
6 small or trivial or absent residual flow at most
7 recent follow-up. Again, the median follow-up was 4.6
8 years.

9 Additional data which I am not presenting
10 includes information from three non-pivotal cohorts.
11 The first is the CardioSEAL High Risk Study, patients
12 without a VSD. There were 271 such patients with a
13 device implanted. The second non-pivotal cohort is
14 from the Clamshell I registry, again non VSD patients.
15 There were 414 patients who received the device.'

16 Finally, the CardioSEAL High Risk Study
17 patients with acquired VSD following an infarction and
18 there were five of those. Each of these cohorts is
19 described in more detail in the Panel Package.

20 We would like to point out that in the
21 entire series of 690 patients, only one device related
22 adverse event led to device removal and that was in a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 7-year-old with thrombus noted on the device nine
2 years after PFO closure.

3 I would like to now reintroduce Dr. Kathy
4 Jenkins who will summarize the conclusions.

5 DR. JENKINS: So in conclusion in patients
6 at high risk for poor outcomes after surgery, VSD
7 closure using a transcatheter CardioSEAL device
8 resulted in successful defect closure and shunt
9 reduction in over 80 percent of cases by six months
10 after implantation.

11 Similarly, device closure resulted in an
12 improved clinical status in 72 percent of patients.
13 Device arm fractures were observed in 16 percent of
14 implanted devices. However, all were identified
15 incidentally. No clinical consequences have been
16 attributed to fractures in CardioSEAL devices used to
17 close VSDs.

18 Peri-procedure events occurred frequently
19 but most were successfully treated. One infant death
20 was directly attributed to the procedure. Only two
21 patients have ongoing clinical impairment from
22 moderately serious or serious device or implant

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealgross.com

1 related events both with valve injuries.

2 Late onset adverse events attributed to the
3 device were not observed in the pivotal cohort.
4 Extended follow-up in a similar series of patients
5 implanted with a predecessor device suggest that late
6 device related events are rare.

7 Thank you very much.

8 DR. TRACY: Thank you very much.

9 We'll move on to the FDA presentation.

10 MS. BUCKLEY: Good afternoon. Again, my
11 name is Donna Buckley and I'm a mechanical engineer in
12 the Interventional Cardiology Devices Branch of the
13 Office of Device Evaluation. I'm also the lead
14 reviewer for the CardioSEAL Septal Occlusion System
15 PMA submission, P000049.

16 Dr. John Stuhlmuller, the medical officer
17 for this submission, and I will present the FDA
18 summary for the CardioSEAL System. This device is a
19 transcatheter septal defect occlusion system used in
20 the treatment of high risk ventricular septal defects
21 (VSDs).

22 You're being asked to discuss and make

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 2344433

www.nealrgross.com

1 recommendations on the sponsor's PMA submission. Your
2 points of discussion of the clinical study results and
3 labeling recommendations will be taken in to
4 consideration by FDA in the evaluation of the
5 application. Finally, you'll be asked to vote on the
6 approvability of this device.

7 The FDA summary will provide a brief
8 overview of the following:

9 The FDA Review Team, the device description,
10 HDE approval, nonclinical evaluation, clinical
11 evaluation, and the questions to the panel.

12 Members of the FDA review team include
13 myself, Donna Buckley, and Dr. John Stuhlmuller from
14 the Office of Device Evaluation; Dr. Lakshmi
15 Vishnuvajjala from the Office of Surveillance and
16 Biometrics who served as the statistical reviewer; and
17 Ms. Liliane Brown from the Office of Compliance who
18 coordinated FDA inspection of the investigational
19 sites.

20 The occluder is a double-umbrella design
21 with a nitinol metal frame and attached polyester
22 material. Four sizes are available ranging from 17 to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 2344433

www.nealgross.com

1 33 mm. The device size to stretched defect diameter
2 ratio is generally 1.7 to 2.0 to 1. The implant is
3 loaded into the 10F delivery catheter using the Qwik
4 Load device. It is attached to the delivery system,
5 tracked through the delivery catheter, and deployed
6 across the defect.

7 The delivery catheter is 10F in size. The
8 Qwik Load device, and I apologize for repeating, is
9 attached to the delivery system. It is used to
10 collapse and load the occluder into the delivery
11 catheter.

12 A Humanitarian Device Exemption or HDE is an
13 application that is similar to a premarket approval or
14 PMA application, but exempt from the effectiveness
15 requirements of a PMA. An approved HDE authorizes
16 marketing of a Humanitarian Use Device where a
17 Humanitarian Use Device is defined as a device that is
18 intended to benefit patients in the treatment and
19 diagnosis of diseases or conditions that affect fewer
20 than 4,000 individuals in the United States.

21 As previously indicated by the sponsor, the
22 CardioSEAL device was approved under an HDE in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 September of 1999 for the same intended use as
2 proposed in this PMA application; HDE No. H9900005.

3 In vitro or bench testing as outlined in
4 Section 1.4 of the FDA Summary was performed to
5 evaluate the mechanical integrity and function of the
6 CardioSEAL System.

7 Biocompatibility testing of the device
8 components was conducted in accordance with ISO
9 Standard 10993. Studies in several different animal
10 models were conducted with the CardioSEAL System. The
11 results of the in vitro testing, biocompatibility and
12 animal testing all demonstrate the integrity and
13 functionality of the device for its intended use,
14 There are no outstanding non-clinical testing issues
15 at this time.

16 Now Dr. John Stuhmuller will summarize the
17 clinical evaluation of the device.

18 DR. STUHMULLER: Good afternoon. My name is
19 John Stuhmuller. I'm a medical officer in the
20 Interventional Cardiology Devices Branch in the
21 Division of Cardiovascular and Respiratory devices.
22 I am going to provide a brief overview of the clinical

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 information contained in the PMA.

2 The sponsor has provided information for
3 five different clinical data sets. First is the
4 pivotal cohort for VSD closure.

5 The non-pivotal clinical data sets include
6 the following: Clamshell I follow-up for VSD closure,
7 high-risk registry for non-VSD closure, Clamshell I
8 follow-up for Non-VSD closure, and acquired VSD
9 status-post myocardial infarction. Only the pivotal
10 cohort for VSD closure will be reviewed at this time.

11 The pivotal cohort for VSD closure is a
12 retrospectively derived patient subset. of the High-
13 Risk Registry. "Complex" VSDs eligible for device
14 closure included defects not accessible to closure
15 through an atrial or aortic approach, those associated
16 with other cardiac pathology, patients with single or
17 multiple defects, or patients at high surgical risk.

18 The registry is an open-label single-arm
19 registry without a control group. Enrollment in the
20 registry is consistent with the compassionate use
21 criteria as outlined in the Expanded Access provisions
22 of the Food and Drug Administration Modernization Act

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 of 1997.

2 The registry is also primarily a single-
3 center study.

4 A total of 74 patients were identified for
5 inclusion in the pivotal cohort for VSD closure.
6 Devices were placed in 57 and 58 patients in which
7 device placement was attempted. Multiple procedures
8 were completed in 6 patients. Multiple devices were
9 placed in 26 patients.

10 Patient outcome assessment for effectiveness
11 was completed using the Clinical Status Scale.
12 Patient outcome assessment for safety was by
13 evaluation of potential anticipated and unanticipated
14 adverse events.

15 The Clinical Status Scale was developed by
16 the investigators at Boston Children's Hospital for
17 use in evaluation of patients enrolled in the High-
18 Risk Registry.

19 The scale consist of eight nominal variables
20 each using an ordinal scale for patient outcome
21 assessment. Each ordinal scale was developed so that
22 change of one in either direction on the scale

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 represents a clinically meaningful change.

2 Effectiveness was determined at six-month
3 follow-up using the Clinical Status Scale. Forty-four
4 of 57 implanted patients completed follow-up. The
5 Anatomical Scale was used pre-procedure and at six
6 months in 14 patients. The Left-to-Right Shunt Scale
7 was used pre-procedure and at six months in 22
8 patients.

9 Different scales were used in eight
10 patients. The Anatomical Scale was used pre-procedure
11 and the Left-to-Right Shunt Scale was used at six
12 months in eight patients.

13 Based on the method of analysis provided by
14 the sponsor, a median change of two categories was
15 demonstrated and 84 percent of the procedures were
16 considered successful at six months.

17 In terms of safety, patient evaluations were
18 scheduled at one, six, 12, and 24 months. Adverse
19 events by time of event are reported as with two days
20 of implant, two days to one month, one month to six
21 months, and six months to most recent follow-up.

22 Adverse events were characterized as device

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 related with a separate analysis for device arm
2 fractures, implantation related and catheterization
3 related.

4 Adverse events were noted in 57 of 58
5 patients in which device placement was attempted. A
6 total of 222 adverse events were noted. At lunch we
7 corrected a typographical error for device arm
8 fractures.

9 On your handout I believe it's going to read
10 34 of 107 and it was corrected. There were a total of
11 32 device related events, 35 implantation related, 85
12 catheterization related, and device arm fractures were
13 noted in 17 of 107 devices.

14 Next Donna Buckley will review the panel
15 questions that we would like to receive input on.

16 MS. BUCKLEY: The sponsor has submitted data
17 to support approval of the CardioSEAL device for
18 closure of ventricular septal defects defined as
19 complex. The data in support of this application has
20 been provided from primarily a single-center,
21 uncontrolled, registry study sponsored by Boston
22 Children's Hospital.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

1 The complexity of VSD in patients entered
2 into this registry has been defined variously as VSD
3 not accessible to closure through an atrial or aortic
4 approach, associated with other cardiac pathology,
5 patients with single or multiple muscular septal
6 defects, or simply patients at high risk for surgery.

7 Question 1a: Based on the information
8 provided, please discuss the description "complex VSD"
9 as the defining indication for use of the CardioSEAL
10 device.

11 Question 1b: In the absence of a control
12 group, please discuss how to evaluate the safety and
13 effectiveness of the CardioSEAL device.

14 A "Clinical Status Scale" was used to
15 evaluate efficacy. The primary efficacy evaluation
16 includes a comparison of the pre-procedure and six-
17 month shunt using both the Left-to-Right and Anatomic
18 Scales, also called the Clinical Status by Lesion
19 Measure.

20 In order to evaluate safety, adverse events
21 were recorded and categorized as serious, moderately
22 serious, not serious, and unknown seriousness. Events

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

1 were also categorized as device related, implantation
2 related, or catheterization related.

3 Question 2: Does the Clinical Status Scale
4 allow for a clinically meaningful assessment of
5 effectiveness for the device?

6 Question 3: Based on the data provided and
7 your comments regarding questions 1 and 1, please
8 discuss whether these data provide reasonable
9 assurance of safety and effectiveness.

10 A summary of the Physician Training Program
11 has been provided in Section 5 of the Panel Package.

12 Question 4a: Please discuss any improvements
13 that could be made to the training program.

14 Question 4b: More than one device was placed
15 in 26 patients. Please discuss training issues
16 regarding the placement of multiple devices in a
17 single patient.

18 One aspect of the pre-market evaluation of
19 a new product is the review of its labeling. The
20 labeling must indicate which patients are appropriate
21 for treatment, identify potential adverse events with
22 the use of the device, and explain how the product

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 should be used to maximize benefits and minimize
2 adverse effects. Please address the following
3 questions regarding the product labeling.

4 Question 5a: Please comment on the
5 INDICATIONS FOR USE section as to whether it
6 identifies the appropriate patient populations for
7 treatment with this device.

8 Question 5b: Please comment on the
9 CONTRAINDICATIONS section as to whether there are
10 conditions under which the device should not be used
11 because the risk of use clearly outweighs any possible
12 benefit.

13 Question 5c: Please comment on the
14 WARNING/PRECAUTIONS section as to whether it
15 adequately describes how the device should be used to
16 maximize benefits and minimize adverse events.

17 Question 5d: Please comment on the
18 OPERATOR'S INSTRUCTIONS as to whether it adequately
19 describes how the device should be used to maximize
20 benefits and minimize adverse events.

21 Question 5e: Please comment on the remainder
22 of the device labeling as to whether it adequately

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

www.nealrgross.com

1 describe how the 'device should be used to maximize
2 benefits and minimize adverse events.

3 The Panel Package includes the available
4 two-year data for the CardioSEAL device in the pivotal
5 cohort. In addition, data were provided from the
6 Clamshell I follow-up study for some patients followed
7 out to 12 years. Long-term adverse effects that may
8 be associated with device implantation include late
9 thrombosis formation, the risk of endocarditis,
10 problems with late operation, and arrhythmias.

11 Question 6: Do you believe that additional
12 follow-up data or post-market studies are necessary to
13 evaluate the chronic effects of the implantation of
14 the CardioSEAL device? If so, how long should
15 patients be followed and what endpoints and adverse
16 events should be measured?

17 Thank you.

18 DR. TRACY: Thank you. We'll move on to the
19 open committee discussion. Dr. David.Skorton was the
20 lead reviewer. We'll ask him to begin.

21 DR. SKORTON: Thank you and thanks for the
22 presentations. Before I start my questions, I just

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

1 want to take a moment to commend the sponsor and the
2 researchers for tackling a very, very difficult
3 clinical problem which doesn't have any easy answers.

4 However, having said that, I have a few
5 questions to ask. Philosophically what we're looking
6 at is an uncontrolled study where the efficacy
7 measures are largely semi-quantitative. The leap of
8 faith is that you really cannot do surgery on these
9 patients.

10 I have a question for the surgeon who spoke
11 earlier. I apologize, I forgot the gentleman's name.
12 The data that we're shown for the bad outcomes of
13 ventriculotomy incisions were from the '70s and '80s.
14 Of course, we don't see ventriculotomy incisions as
15 much anymore because of those data. Please help me to
16 understand what are the data for those few patients
17 nowadays that do have to have ventriculotomy
18 incisions:

19 Obviously, all of us occasionally do have to
20 send patients for ventriculotomy. Maybe not for
21 congenital heart disease but sometimes to close peri-
22 infarction VSDs. Can you help us to understand what

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, DC. 20005-3701

(202) 234-4433

www.nealrgross.com

1 those data look like today?

2 DR. MAYER: That's a little bit difficult to
3 answer actually. I will answer it the following way.
4 Based on that information, we as an institution sort
5 of went away from what had been the previous approach
6 of doing a left ventriculotomy for patients with
7 defects in this area.

8 We have a little bit of clinical experience
9 with maybe seven or eight patients -- I can't remember
10 the number exactly -- which we have approached through
11 a lower sort of periseptal, if you will, incision but
12 that is a subset of apical VSDs. I chose the words
13 relatively carefully that the ones that are further
14 back that are more posterior are ones that we continue
15 to have problems with.

16 I don't have the data to tell you how many
17 of those patients have been approached surgically,
18 although I would say the numbers are relatively small
19 at this point. Clearly it depends a little bit on the
20 size of the defect and the location.

21 Clearly there are a number of muscular VSDs
22 that we can approach transatrially or through a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealgross.com

1 limited anterior ventriculotomy. That's why in
2 particular those patients who would require a left
3 ventriculotomy or an extensive right ventriculotomy
4 are the ones that we are sending to the cath lab
5 basically.

6 The other subset of patients, and there are
7 a significant number in this series, are ones in which
8 previous surgical attempts have failed typically in
9 those areas. I guess that is one indicator that you
10 have is that prior surgeons both in our own
11 institution and elsewhere have failed to close the VSD
12 because it was difficult to access surgically. A
13 significant chunk of the total pivotal cohort are, in
14 fact, post-operative VSDs with residua.

15 DR. SKORTON: Fair enough. Thanks. My next
16 couple questions are truly like one big question. It
17 has to do with a part Clinical Status Scale. It's
18 probably a statistical question and partly clinical
19 question.

20 I saw that you used a non-parametric rank
21 test which I think is admirable because who knows what
22 the distribution of these factors are.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 I'm assuming that your assumption using a
2 rank test across all of these is that one category in
3 each row of the scale has equivalent clinical
4 significance.

5 DR. GAUVREAU: By using a non-parametric
6 rank test it's only assuming that the categories have
7 a certain order to them but not that the difference
8 between a two and a three is the same as the
9 difference between a three and a four, but just that
10 a three is better than a two and a four is better than
11 a three.

12 DR. SKORTON: Let me restate it. It's a
13 point well taken. The definition was, as I understand
14 it, for each scale that one step is supposed to
15 indicate something of clinical significance. Is that
16 fair?

17 DR. JENKINS: Yes. Your statement the way
18 you first made it is correct. When we tried to design
19 the efficacy outcome for the trial, initially we
20 proposed echo closure status for the complex cohort
21 that included VSDs and other indications.

22 Actually, the FDA required us to create a

1 more quantitative method to follow patients. It was
2 a complex cohort with multiple indications. We
3 actually did some consulting and one of the
4 biostatisticians at the Harvard School of Public
5 Health helped us construct the parallel but equivalent
6 scales exactly with the assumption that you propose so
7 that we could say something about the cohort overall.

8 When you carve out the subgroups, for
9 example, in the clinical status by lesion assessment
10 or some of the other subgroups, that problem falls
11 away. In the clinical status by patient assessment,
12 your assumption is exactly correct.

13 DR. SKORTON: Thank you. So following up on
14 that, I just have a couple questions. I don't mean
15 for these to be cheap shots. I'm really asking
16 because I'm trying to understand how they were used.

17 The anatomic scale that measures VSD
18 diameter as a percentage of aortic root diameter, I'm
19 assuming some of these VSDs were multiple holes near
20 the septum near the apex or anterior septum.

21 How do you figure out in a multiple hole VSD
22 what the diameter is that you have a single number to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 compare against aortic root diameter if there were,
2 say four holes?

3 DR. JENKINS: I think that you might have
4 noticed that the sample size dropped for the six-month
5 efficacy assessment. The reason for that is that
6 there were substantial number of assessments. It
7 wasn't that only 44 patients achieved the six-month
8 follow-up.

9 Actually, the follow-up is 100 percent in
10 this study. It's that the assessments were considered
11 to be inadequate to make a complete determination of
12 VSD diameter or lesion shunt size.

13 The multiple jets that were greater than two
14 were quoted as more than small. There were quite a
15 number of cases where people didn't feel comfortable
16 making an assignment and that's where the missing data
17 comes from.

18 DR. SKORTON: Okay. Thanks. You just
19 answered the next question, too. I appreciate that.

20 Could you review for me one more time in the
21 assessment of clinical status by lesion? My
22 understanding, and I apologize if I got this wrong, is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealgross.com

1 that you use different measures for the initial
2 assessment than for the follow-up assessment. Is that
3 right?

4 DR. JENKINS: Not in all cases and not in
5 most. Only in patients who had initially a placement
6 of a pulmonary artery band so that they couldn't be --
7 our attempt was to create the entire scale with the
8 physiological consequences of the whole. That was the
9 intent.

10 Unfortunately for banded patients, that
11 broke down because they might have known that shunt
12 and still have a big hole in their heart. They would
13 be neither "blue" nor have a right left shunt. We
14 tried to formalize an anatomically based assessment
15 that we felt would be equivalent to the shunt based
16 scale.

17 In other words, what size hole would have
18 resulted in what size shunt if you could do what you
19 couldn't do which is take the band off and measure it.
20 That was the numbers that we came up with there.

21 DR. SKORTON: Okay. The last question,
22 which I've been told is fair game to the sponsor and

NEAL R. GROSS'

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 2344433

www.nealgross.com

1 not to the investigators, is it looks to me like the
2 application is aimed at a relatively small number of
3 the sickest of the sick, difficult to operate
4 patients. I'm just curious what the motivation is to
5 convert this from an HDE to a PMA? It's a question
6 for the sponsor.

7 MS. KULIS: My name is Anne Kulis and I'm
8 with Regulatory Affairs and NMT Medical. I would say
9 that the primary motivation was that with an HDE there
10 are significant administrative requirements such that
11 IRB approvals are required for each institution before
12 the site can receive devices. Our hope in converting
13 this from an HDE to a full PMA approval was to reduce
14 the burden both for the institutions as well as for
15 the company.

16 DR. SKORTON: My understanding, and I could
17 have this wrong, but I'm in charge of the IRBs for our
18 university and my understanding on HDEs is that you go
19 through IRB approval of the protocol but you don't
20 need to take informed consent on each patient. You
21 don't need to get IRB approval of every single case
22 but of the protocol.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 I agree it's certainly more of a burden than
2 not doing it but it's not the same as a research
3 protocol as I understand it where you have to get
4 approval and informed consent of each patient.

5 DR. JENKINS: If I could just answer that
6 because we've gotten quite -- when we got our original
7 HDE approvals I was actually the recipient of multiple
8 phone calls from all over the United States about
9 this. It's very IRB dependent. It's very
10 institutional dependent.

11 There are some institutions in our high-risk
12 trial that chose to stay as part of the high-risk
13 trial because they couldn't get the HD approved at
14 their sites. It was actually more burdensome than
15 having our trial approved.

16 There were some that treated it almost like
17 it was an approved device that was on the shelf and it
18 was an off-label use. Some of the academic centers
19 who were maybe more fearful or more conservative
20 really did place quite a few hurdles to investigators.
21 We also have two investigators here who have enrolled
22 VSD patients under HD approvals who might be able to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202)234-4.433

www.nealrgross.com

1 talk about the issues at their center.

2 DR. SKORTON: That's okay. I'll take your
3 word for it. I'm done.

4 DR. TRACY: I guess we started at that end
5 of the table last time so I'll shift over and ask Dr.
6 Crittenden to raise questions.

7 DR. CRITTENDEN: I, too, enjoyed reading the
8 Panel Pack. I thought it was very interesting and I
9 agree this is a cohort of patients who need a lot of
10 help and surgery is probably not a good answer.

11 I, too, like Dr. Skorton, have some
12 concerns. Not so much concerns but questions about
13 this Clinical Status Scale. Have you done anything to
14 look at the validity of this to see whether or not if
15 you take a second group of patients and look at it
16 whether or not this really makes any sense whether
17 it's valid?

18 DR. JENKINS: No, we haven't done any
19 interater or other types of validity checks. What we
20 did do, though, is that the echo closure status was
21 reviewed by the core laboratory and we did revise the
22 clinical status assessments afterwards. This is a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealgross.com

1 scale that was really designed specifically for this
2 study. It doesn't really have any external validity
3 beyond this other than face validity.

4 DR. CRITTENDEN: So the FDA didn't ask you
5 to do it, you would have just presented the echo data,
6 I presume, for efficacy?

7 DR. JENKINS: That's probably right.

8 DR. CRITTENDEN: The other question I had is
9 there are a number of device fractures. Is there
10 anything to be done about that or you just watch them
11 over time?

12 DR. JENKINS: The rate of device fractures
13 in this study is about half what it was with the
14 predecessor Clamshell device. In the entire high-risk
15 trial to date, we've actually scrupulously screened
16 for fractures with out chest x-ray core lab review and
17 with fluoroscopies.

18 We found them as an incidental finding in
19 about 16 percent of this group of patients and in the
20 cohort overall. As of yet, we haven't found any
21 events that were definitely or probably related by the
22 safety committee to the fractures.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealgross.com

1 There were three instances in the non-
2 pivotal cohort, the non-VSD cohort where a patient
3 experienced palpitations at the time or around the
4 time that a fracture was detected at the same
5 endpoint. In those three cases the committee quoted
6 those events as possibly or plausibly related to a
7 fracture but there was nothing else.

8 There had been a rare number of events in
9 the original Clamshell I cohort that were attributed
10 to fractures with masses in the heart or minor
11 shifting of the device. We haven't observed that with
12 the new CardioSEAL device.

13 DR. CRITTENDEN: Does this affect the
14 endothelization of the device? Does it change that at
15 all?

16 DR. JENKINS: I don't know for the
17 CardioSEAL device but we did recently, and I think
18 it's imminently about to come out in the literature,
19 presenting a paper on the explant data from the
20 Clamshell I cohort. In that analysis where we had
21 really very good pathological information in all the
22 explants, there seemed to be no association at all

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 2344433

www.nealrgross.com

1 with endothelization in the presence of a fracture.

2 DR. CRITTENDEN: That's all I have.

3 DR. TRACY: Dr. Wittes.

4 DR. WITTES: I have very little also. It
5 was very hard for me to calibrate the results against
6 what one would have expected because there was not
7 only no control but nothing that described what you
8 would have expected. Not being a cardiologist I
9 didn't know what to expect. That was very hard for
10 me.

11 I also struggled with the very same issue
12 that you brought up about making the assumption that
13 changing from one to two on one row is the same as
14 changing from one to two in another row. I would have
15 been nicer obviously if you had been able to have
16 everybody in one row or the other because then at
17 least you would see -- then you would know whether you
18 have improvement or not.

19 I am particularly uncomfortable about those
20 people who changed rows and whether the improvement
21 that you see is truly a clinical improvement. I mean,
22 the improvement that you code is truly a clinical

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 2344433

www.nealgross.com

1 improvement.

2 DR. JENKINS: I think that the clinicians
3 answer but not the data person's answer to that would
4 be that most of the patients who changed rows on the
5 primary assessment did so because they had a pulmonary
6 artery band actually removed.

7 In general, that's not possible to do if you
8 haven't successfully closed a VSD because you can take
9 the pulmonary artery band off and the patient goes
10 into congestive heart failure.

11 The fact that the patients were able to
12 subsequently undergo pulmonary artery band removal is
13 not quantitative but it is sort of a sign that the VSD
14 was being at least partially successfully treated.

15 DR. WITTES: I actually was asking that
16 clinical question. I guess the other issue then would
17 be is if this moved into a different center, how
18 center dependent. Again, it's an unanswerable
19 question but it's a question that as I read I wonder.

20 DR. JENKINS: There were multiple
21 interventionalists involved at one center but the bulk
22 of the data was from one center. I think I would like

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 to ask Dr. Hoyer or Dr. Boucek to talk about their
2 experience under the HDE approval.

3 DR. HOYER: Hi. I'm Mark Hoyer from Riley
4 Hospital in Indianapolis. I have no financial
5 interest in NMT Medical. I was asked to come here
6 today and my expenses are being reimbursed today.

7 To answer, I think, Dr. Skorton's question
8 as well and then moving on, the HDE approval is very
9 different than the PMA. I've actually had experience
10 in two locations. I have been in Florida and had to
11 get approval.

12 Fortunately, somebody had paved the way
13 already with the HDE category of approval which
14 allowed me to kind of get in much more easily. We
15 still required informed consent for every patient. In
16 Indianapolis the exact same thing has held true. It
17 is indeed an IRB approval.

18 Actually, although the IRB approval was
19 easier in Florida, it's been more difficult and there
20 was an entire full review board there in Indianapolis.
21 In fact, we still get informed consent for every one
22 of those patients.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 We've been involved in closing a few of
2 these complex VSDs. Obviously not the 57 patients
3 that have been reported in the high-risk protocol
4 already. We actually have been involved with three
5 closures in two patients so obviously one of those had
6 multiple defects.

7 I think the logistics of that has actually
8 worked out pretty well. It requires some training
9 clearly. I was proctored initially in Florida for
10 fenestrated Fontans so I had some device experience
11 and then came to Indianapolis and was able to carry
12 that forward. That's basically been my experience
13 thus far. I'll let Dr. Boucek answer some more unless
14 there is anything else specifically.

15 DR. BOUCEK: I would basically support what
16 Dr. Hoyer said. I also have no financial interest in
17 N-MT. My travel arrangements were provided for.

18 We've done more like eight or so infants
19 under the HDE. Frequently they are extremely ill
20 children like you've heard about. Often they are
21 referred to our institution for consideration of
22 transplantation because they've had previous surgical

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234433

www.nealrgross.com

1 attempts to close the VSD which have been unsuccessful
2 in children who are quite symptomatic.

3 It would be virtually impossible to resubmit
4 them to another operation to try to close residual
5 VSDs. These are very sick children and I think
6 because of the experience that we've learned from what
7 the group at Boston Children's has done, we've
8 actually not had near what appears to be the
9 difficulty placing these as reported here.

10 I think there has been a learning curve
11 which has been communicated to the community. We've
12 not had the problems with heart block and things like
13 that. I think we've learned from other's experience.

-14 This is certainly something I think can be
15 done in an institution where there is an active
16 interventional laboratory. I think we usually have
17 the capability for surgical backup but we've never had
18 to utilize it.

19 I think with appropriate anesthesia
20 preparation and training, most of the adverse events
21 that you've heard about can be anticipated. Now, in
22 fact, we actually prevent them or prophylax them

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 through anticipation rather than responding to them
2 when they occur.

3 DR. TRACY: Dr. McDaniel.

4 DR. MCDANIEL: Thank you for those comments.
5 I had a couple of questions when reading through this
6 in kind of a general -- let me figure out what the
7 heading is here. Under CONTRAINDICATIONS I was just
8 curious. It says, "Anatomy which the CardioSEAL size
9 required would interfere with intercardiac or
10 intravascular structure such as valves or pulmonary
11 veins."

12 I guess the pulmonary vein is the part I
13 don't understand. I know you have to do a trans-
14 septal cath to get there but is it the whole procedure
15 you are referring to so there may be injury to the
16 pulmonary veins in that sense? Because the CardioSEAL
17 sitting in a VSD position shouldn't interfere. It's
18 in a couple of places and I'm just -- or is that more
19 related to its use?

20 DR. TRACY: That doesn't correct for the VSD
21 indication.

22 DR. MCDANIEL: Okay. It's probably related

1 to the ASD closure. I thought that.

2 Then a couple of comments on the patient's
3 guide to device and the closure. Again, I read these
4 fairly carefully. In the first sentence it's referred
5 to as a ventricular septal hole. 'Most patients who by
6 this time are pretty much -- they know it's a VSD or
7 you could spell it out.

8 I think that is kind of unusual language.
9 On the second page where you're talking about the use
10 of TEE, it should probably say TEE involves using --
11 putting an ultrasound probe to a patient. I'm not
12 sure what they would think that might be.

13 My only other comment on the patient or
14 family information is that you don't at all refer to
15 the trans-septal part of the procedure passing all the
16 wires in and out of the body. I'm not making any
17 comment whether it should be in there.

18 It's a very complex procedure but the
19 illustrations really imply that it's a fairly simple
20 procedure. You go from the neck, pop this thing
21 through, and then you're done. I don't know if that
22 needs further explanation or not but it was just

NEAL R. GROSS

1 something that I initially was confused because I knew
2 they had to come from the left side. This was a bit
3 confusing to me.

4 I have a couple more questions. I think
5 that's it.

6 DR. TRACY: Dr. Laskey.

7 DR. LASKEY: I really have only
8 congratulatory comments so I'll be brief. These are
9 critically ill kids and, I guess, at some point
10 adults, too. Anything you do' for them that a surgeon
11 doesn't want to tackle has to be respected.

12 I think that the clinical outcome measure
13 that you struggled with is really overkill. I think
14 the data kind of speak for themselves in terms of the
15 unbanding, as you said, and just general clinical
16 improvement.

17 There are so many more questions with the
18 methodology that is so limited, as you said, that they
19 almost had to do better. You started out by giving
20 them the worse possible rank they could have had by
21 giving them the minimum number and so forth, not just
22 by reverse regression to the mean but the way it's set

1 up they had to do better.

2 My question to you is you had a few people
3 in your histograms who did worse. Is there something
4 that you now know about how to tell who is going to do
5 worse with this assuming it's a technically successful
6 implant? Who should you not approach with this
7 device?

8 DR. JENKINS: I guess I'll answer as well as
9 anyone else in the room. I think that the technique
10 needs to be very cautious in **small** infants as
11 indicated by the infant who died directly as a result
12 of the procedure. I also think that several of the
13 failures were attempts at septation where septation
14 was probably not possible.

15 I think that's a clinician learning curve as
16 opposed to something technical. Hopefully we will
17 eventually be able to refine our understanding of what
18 is septable and what isn't. Those would be my main
19 comments.

20 DR. BOUCEK: If I could just add frequently
21 you are doing these in situations where there is
22 nothing else to offer and the families are obviously

1 quite interested in trying to avoid heroic therapy
2 like transplantation. If you could effectively
3 septate a child that the surgeons had refused to
4 operate on for standard repair, then that would have
5 a significant impact on that child.

6 There may be a child who you can't
7 effectively septate but because the damage to the
8 myocardium from previous surgery or such things will
9 still go on to need a transplant or may not survive.
10 I'm not sure that is a contraindication they are
11 trying to help those children.

12 I think the children that probably should be
13 excluded are the ones that they have in the panel
14 where it's likely that the act of closing the defect
15 is going to predictably result in damage to the
16 myocardium such as the AV valves or the semilunar
17 valves.

18 I think ultimately we would hope that many
19 of the children whose hearts are damaged by attempts
20 to close complex VSDs at surgery could be done
21 primarily with catheter techniques and avoid some of
22 the children who right now actually get damaged trying

1 to do a standard surgical closure.

2 DR. LASKEY: Yes. These patients are beyond
3 the pale so there are no rules here really. I think
4 you are to be congratulated on what you have done.

5 I just have one other question. Is it an 11
6 French upper --

7 DR. BOUCEK: Ten French.

8 DR. LASKEY: No problems in kids?

9 DR. BOUCEK: I think size is an issue as has
10 been indicated that if you get down to very small
11 infants that's an issue but we put them in infants to
12 six kilograms and it has been well tolerated and been
13 able to go back through the internal jugular vein.

14 Of course, if we do procedures like ecmo
15 where we put canulas into the internal jugular vein,
16 they are much bigger than even that 10 French so there
17 is precedent for putting large structures like that
18 into the internal jugular vein.

19 DR. LASKEY: Thank you.

20 DR. TRACY: Thank you. This is obviously
21 just a very incredible patient population. It must be
22 just extraordinarily difficult to get consent for a

NEAL R. GROSS

1 procedure that has a 99 percent chance of an adverse
2 event occurring, a 16 percent chance of a device
3 failure occurring, and a 7 percent chance of death,
4 that offers an 80 percent chance of closure and a 72
5 percent chance of clinical improvement.

6 It sounds like a very difficult thing to
7 walk into somebody's room and explain that to them.
8 I think this would have to be part of the physician
9 training to tell people how they can deal with that.

10 DR. JENKINS: I think it really has to do
11 with Dr. Boucek was just suggesting which is whether
12 the alternatives that you're offering the family of
13 this doesn't work.

14 The way that we normally approach it in
15 Boston is by explaining to them that the cardiac
16 anesthesiologists are going to be at their side and
17 are going to walk them through the procedure and be
18 there to hopefully take care of anything that comes
19 up.

20 We don't send people into this procedure
21 with a rosy hope that everything will be absolutely
22 perfect but with the hopefulness that if the

1 procedures are successful, that they may avoid needed
2 to go through something that would be even worse or
3 just not making it.

4 DR. HOYER: If I could say another thing.
5 Mark Hoyer. That brings you to the issue that you're
6 faced with a complex patient problem and options that
7 you want to discuss with a family, whether that be
8 surgery.

9 We've already heard that the surgery may be
10 extremely high risk. Then we bring into this that we
11 have the possibility of maybe using a device to close
12 a defect in the cath lab, albeit at somewhat higher
13 risk than a normal diagnostic procedure would be.

14 Then we have to kind of think about the
15 issues of what the burden might\ be of the
16 administrative aspects of an HD approval versus a PMA
17 and more widespread application of the device.

18 Occasionally what happens is we get lots of
19 questions about insurance issues. It's extremely
20 frustrating or disheartening, I guess, to see a family
21 that might be faced with a decision of a financial
22 burden versus a soul and heartfelt decision for their

(202) 234-4433

www.nealrgross.com

1 child.

2 I think that makes it a difficult thing.
3 Obviously most situations they will opt for doing what
4 they possibly can for their child. It does not -- it
5 still enters into the equation and becomes a
6 consideration in their minds and they do ask about it.

7 DR. BOUCEK: I agree with you completely.
8 If I had to hear this list of potential adverse events
9 from the procedure, I think I would run as fast as I
10 could from the hospital.

11 What we usually do actually is put a side-
12 by-side consent with surgical and device and try to
13 compare the relative incidence of these complications
14 or adverse events with either procedure since that is
15 really their only two options since these children
16 don't have the option of saying, "I'm just going to
17 leave and pick my battle another day."

18 They really need something done and they
19 have to make that decision. We go through each one,
20 what is the incidence of an air embolus being on
21 bypass, what is the incidence with this type of
22 procedure, and try to give them what we think is the

NEAL R. GROSS

(202) 234-4433

www.nealrgross.com

1 fairest comparison we can.

2 Then we have some parents that because this
3 is still considered "investigation," they will say,
4 "I'll stick with surgery." I think that is one of the
5 reasons that this sort of onus may have an impact on
6 a patient's decision about what may be best for them.

7 DR. TRACY : I think that the patient
8 education material, I agree, I like the idea of having
9 something to give but it just looks like you're going
10 to pop that thing in there and pull that little thing
11 back.

12 I think it needs to be redone to show the
13 complexity of the trans-septal snaring, etc., etc.
14 That may actually help with the consent because the
15 patients can -- the family then can understand the
16 complexity of the procedure that the child is about to
17 undergo.

18 Just a couple others for my own curiosity.
19 Why do upsize to a 1.7 to 2 to 1 size on the size of
20 the occluder that's used? Do you stretch it out
21 intentionally? That seems like you would be
22 increasing the risk of mechanical problems or

NEAL R. GROSS

WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealgross.com

1 arrhythmic problems. Is that because they are sort of
2 generated areas or why is that thing so big?

3 DR. BOUCEK: Well, you don't really stretch
4 out the area with this type of device. With a sizing
5 balloon you try to get an indentation in the balloon
6 so you know what the size of the balloon is. Of
7 course, the center pin on this device does not impinge
8 upon the edges of the VSD.

9 The flanges tend to reach around the edges
10 of the VSD so you don't expand the size of the defect
11 the way that some other types of devices do when they
12 are designed to fill the defect from the inside. I
13 think that is a fundamental difference.

14 We found actually that those criteria which
15 were based primarily on closing an atrial septal
16 defect, I think that 1.7 to 2, are probably very
17 conservative when it comes to a ventricular septal
18 defect since the muscle tends to contract down and
19 actually become smaller during the time when the heart
20 would be generating the most pressure which would like
21 result in the device moving.

22 I think those are very conservative. When

NEAL R. GROSS

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 you size these VSDs most end up being a relatively
2 small. Some of the sizing choice in the defect ends
3 up being can you cover adjacent VSDs when there are
4 multiple -- excuse me, VSDs in the same location.

5 DR. TRACY : One other thing. In several
6 places I see that the ACT is 200 milliseconds. You
7 might want to go through and change that.

8 Dr. Aziz.

9 DR. AZIZ: Again, I think I would like to
10 commend the investigators for tackling a difficult
11 problem in these young infants and kids. I want to
12 sort of focus my comments on the adult population, the
13 post-VSD. At least, those are the patients that I
14 have some experience with.

15 This is a group of patients who can be very
16 difficult to manage. I think the management
17 surgically of that condition has evolved over the
18 years with people saying you should wait for a while
19 before you operate on them because hopefully the
20 tissue had sort of scarified so the sutures would stay
21 there.

22 I think the contraindication to that is if

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 200053701

1 you wait, the guys who really need it most die early.
2 Most people have been forced to operate on these
3 patients earlier.

4 I see that you have a small subset of
5 patients who have had post-infarct VSDs. My comments
6 are going to be directed to these patients. A lot of
7 these elderly patients also have concurrent coronary
8 artery disease. In the patients who you propose or
9 think of doing this VSD closure, what is the thought
10 process about handling the coronary artery disease
11 that is present at the same time? Anybody on the
12 panel?

13 DR. BOUCEK: I would imagine Dr. Lock has
14 probably the most experience with the post-MI VSD. I
15 have no experience with it.

16 DR. JENKINS: I'd like to say that post-
17 infarction VSD was not considered as part of the
18 labeling indication for this submission. Primarily
19 because of the small amount of data that we had, we
20 really didn't think it was sufficient to show safety
21 and efficacy in that small group.

22 DR. LOCK: I have two comments on the post-

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 200053701

(202) 234-4433

www.nealrgross.com

1 infarction VSD patients. Most of the patients that
2 have been successfully managed using the entire series
3 of devices that we used have all been post-operative
4 patients.

5 MS. MOYNAHAN: Could you please introduce
6 yourself?

7
8 DR. LOCK: I'm sorry. My name is Jim Lock
9 and I'm from the Children's Hospital in Boston.

10 MS. MOYNAHAN: And any conflict of
11 interests?

12 DR. LOCK: I'm on the Board of Trustees of
13 -- Board of Directors, actually, of Nitinol Medical
14 Technologies. I don't own any stock in the company,
15 although I do -- I am assigned options. I receive
16 compensation for serving on the board which I donate
17 to the Children's Hospital.

18 My institution receives royalties for the
19 commercial sales of a series of different devices that
20 were developed at the Children's Hospital. As an
21 individual I'm assigned some of those royalties from
22 the Children's Hospital.
