File Specification for GEOS-DAS Gridded Output Version 5.3

Global Modeling and Assimilation Office Goddard Space Flight Center, Greenbelt, Maryland

http://gmao.gsfc.nasa.gov

Release Date March 30, 2004; Expiration Date March 30, 2009

Version 5.3 To support EOS with GEOS-4.x

Document maintained by Rob Lucchesi (GMAO, SAIC) Permission to quote from this document should be obtained from the GMAO.

REVISION HISTORY

Version Number	Revision Date	Pages Affected/Extent of Changes	Approval Authority
Version 1.0 (original -	April 8, 1997	All	Not Approved
no electronic copy)	_		
Version 3.0	November 4, 1997	- Added 5 authors	Not Approved
(DAO-1001v3.0)		- Reorganized the document	
		- Replaced Sections 3, 5, 6, and Appendix B	
Version 3.1	January 5, 1998	- Added Figure 1	Rob Lucchesi 1/26/99
(DAO-1001v3.1)	-	- Revised size estimate for single level mis and lsm in	(Closed CR 131)
		Sections 6.1 and 6.2	
		- Made various changes to the list of variables in the	
		assimilated time averaged files in Section 6.3	
Version 3.2	March 4, 1999	- Changed "GEOS-3" to "GEOS-AM1" throughout the	CCB 3/16/99
(DAO-1001v3.2)		document	
		- Updated scope and launch date in Section 1	
		- Provided more detailed description of file format	
		including Dimensions, Variables, and Attributes in Section	
		2	
		- Modified the horizontal resolution and clarified the	
		description of the grids in Section 4	
		- Included version ID in the filename convention described	
		in Section 5.1	
		- The file sizes were updated in Section 6 to reflect the new	r
		horizontal resolution	
		- Improved the description of packing and included	
		directions for unpacking in Section 8	
		- Two sample programs were added in Section 9 to	
		demonstrate using the HDF library and the HDF-EOS	
		library for reading the data files	
		- Updated the description of First Look Analysis and added	
		a description of Late Look Analysis in Appendix A	
		- Added references for the data format	
Version 4.0	May 19, 1999	- Title changed to "File Specification for GEOS-DAS	CCB 5/19/99
(DAO-1001v4.0)		Gridded Output"	
		- Changed details of internal products in Section 1	
		- Added a figure and description of the horizontal grid	
		structure, removed references to sigma levels in the vertical	
		grid description, and indicated differences in the grids of	
		the CHM products in Section 4	
		- Indicated that forecast and analysis products will not be	
		archived for distribution by ECS and removed file-naming	
		information for sigma and forecast products in Section 5	
		- Various changes made to Section 6:	
		- split product table into one table for first look and one for	
		late look	

 added ESDTs - - adjusted the horizontal resolution of CHM products - removed forecast products - added a discussion of the different horizontal and vertical grid structures of the CHM products - Updated the description of First Look Analysis in Appendix A - Added a new table of pressure levels for CHM products and removed the table of sigma levels in Appendix C - Added a new table of pressure levels for CHM products and removed the table of sigma levels in Appendix C - Added a new table of pressure products, 0.2 hPa is now the highest level, changed from 0.1 hPa in earlier documentation Slight adjustment of variable content for targ cld_p, Ato-1001v4.1) anuary 21, 2000 Re-write Section 3 to clarify description of time-averaged products. - Changed AM-1 to Terra throughout document. - Added approval dates to revision history for Version 4.0 and Version 4.1. - Added approval dates to revision history for Version 4.0 and Version 4.1. September 20, 2001 In Table 6.1, adjusted the sizes of three products to match CCB 5/17/00 the detailed descriptions in Section 6.2: DELAXENG changes from 6.7 to 5.8.4 DLLAPCLD changes from 637.8 to 412.9 The horizontal resolution of output products has been change is reflected in Section 3 to describe the different time-averaging characteristics of the GEOS-4.x. system output variables. In particular, 6-hourly time averages now have a different averaging period. This will result in different arrage begin and ed. The grid origin has been changed from the GEOS-4.x system were removed from DAS product descriptions. Variables that were unavailable from the GEOS-4.x system were removed from DAS product descriptions. Variables that were enviously produced by 	Version Number	Revision Date	Pages Affected/Extent of Changes	Approval Authority
- adjusted the horizontal resolution of CHM products - removed forecast products - added a discussion of the different horizontal and vertical grid structures of the CHM products in Appendix A - Added a new table of pressure levels for CHM products and removed the table of sigma levels in Appendix C - Added a new table of pressure levels for CHM products and removed the table of sigma levels in Appendix C - Added references for the data format - Levels 36 and 42 in Appendix C tables were changed from 0.1 to 0.2 because in 3D pressure products, 0.2 hPa is now the highest level, changed from 0.1 hPa in earlier documentation ersion 4.1 August 18, 1999 Slight adjustment of variable content for targ_cld_p. CCB 8/18/99 DAO-1001v4.1) January 21, 2000 Re-write Section 3 to clarify description of time-averaged CCB 1/21/00 products. - Changed AM-1 to Terra throughout document. - Added approval dates to revision history for Version 4.0 and Version 4.1. ersion 4.3 September 20, 2001 In Table 6.1, adjusted the sizes of three products to match the detailed descriptions in Section 6.2: DELAPTMP changes from 357.8 to 412.9 ersion 5.0 DRAFT in upport of GEOS-4.x. November 07, 2001 The table of the entire averaging characteristics of the GEOS-4.x system were removed from 0.18 and 6. DDB 10/31/01 ehange is reflected in Section 5.1 to 12.6 DLLAPTMP changes from 357.8 to 412.9 DDB			- removed sigma products and sigma sizes and definitions	
 removed forecast products added a discussion of the different horizontal and vertical grid structures of the CHM products			- added ESDTs	
- added a discussion of the different horizontal and vertical grid structures of the CHM products - Updated the description of First Look Analysis in Appendix A - Added a new table of pressure levels for CHM products and removed the table of sigma levels in Appendix C - Added references for the data format - Levels 36 and 42 in Appendix C tables were changed from 0.1 to 0.2 because in 3D pressure products, 0.2 hPa is now the highest level, changed from 0.1 hPa in earlier documentationersion 4.1 AAC-1001V4.1)August 18, 1999- Slight adjustment of variable content for tavg_cld_p, tavg3d tmp_p_and tavg3d tmp_p products. ersion 4.2 DAO-1001V4.2)CCB 8/18/99JAO-1001V4.1) AO-1001V4.2)January 21, 2000- Re-write Section 3 to clarify description of time-averaged products. - Changed AM-1 to Terra throughout document. - Added approval dates to revision history for Version 4.0 and Version 4.1. - Changed AM-1 to Terra throughout document. - Added approval dates to revision for 0.2: DFLAXENG changes from 65.7 to 58.4 DLLAPTUM changes from 337.8 to 412.9DDB 10/31/01 changes from 337.8 to 412.9prot of GEOS-4.x.November 07, 2001 vito (0.0W, -90.0S). to regin has been change is reflected in Section 4 and 6. -The grid origin has been change is reflected in Section 4. -Adjustments were made to Section 3 to describe the different time-averaging characteristics of the GEOS-4.x. System output variables. In particular, 6-hourly time averages now have a different averaging period. This will <b< td=""><td></td><td></td><td>- adjusted the horizontal resolution of CHM products</td><td></td></b<>			- adjusted the horizontal resolution of CHM products	
grid structures of the CHM products - Updated the description of First Look Analysis in Appendix A - Added a new table of pressure levels for CHM products and removed the table of sigma levels in Appendix C - Added references for the data format - Levels 36 and 42 in Appendix C tables were changed from 0.1 to 0.2 because in 3D pressure products, 0.2 hPa is now the highest level, changed from 0.1 hPa in earlier documentationersion 4.1 DAO-1001v4.1)August 18, 1999Slight adjustment of variable content for tavg_cld_p, tavg3d tmp p, and tavg3d tmp p products.CCB 8/18/99ersion 4.2 DAO-1001v4.2)January 21, 2000- Re-write Section 3 to clarify description of Time-averaged curent throughout document. - Added approval dates to revision history for Version 4.0 and Version 4.1.CCB 5/17/00ersion 4.3 DAO-1001v4.3)September 20, 2001- In Table 6.1, adjusted the sizes of three products to match DLLAPCLD changes from 37.8 to 412.9ersion 5.0 DRAFT in paport of GEOS-4.x.November 07, 2001- The horizontal resolution of output products has been changed to 288x181. The prior value was 360x181. This change is reflected in Section 3 and 6. - The grid origin has been changed from 1.80.0W,-90.0S) to (0.0W,-90.0S). This change is documented in Section 4. - Adjustments were made to Section 3 to describe the different tareage in predicts. - The brizontal resolution of output products has been changed in Section 4 and 6. - The grid origin has been changed from 1.80.0W,-90.0S) to (0.0W,-90.0S). This change is documented in Section 4. - Adjustments were made to Section 3 to describe the different tareage products. - Hn section 6, variables that were unavailable from the GEOS-4.x. - Hn section 6, variables that were unavailable from the G			- removed forecast products	
FUpdated the description of First Look Analysis in Appendix A - Added a new table of pressure levels for CHM products and removed the table of sigma levels in Appendix C - Added references for the data format - Levels 36 and 42 in Appendix C tables were changed from 0.1 to 0.2 because in 3D pressure products, 0.2 hPa is now the highest level, changed from 0.1 hPa in earlier documentation August 18, 1999 - Slight adjustment of variable content for tavg_cld_p, AAO-1001v4.1) CCB 8/18/99 Anono 10, 1, 10 - Re-write Section 3 to clarify description of time-averaged products. CCB 1/21/00 ersion 4.2 January 21, 2000 - Re-write Section 3 to clarify description of time-averaged products. CCB 1/21/00 - Changed AM-1 to Terra throughout document. - Added approval dates to revision history for Version 4.0 and Version 4.1. CCB 5/17/00 AO-1001v4.3) September 20, 2001 - In Table 6.1, adjusted the sizes of three products to match the detailed descriptions in Section 6.2: DTLAYENG changes from 160.1 to 112.6 DLLAPTMP changes from 160.1 to 112.6 DLLAPTMP changes from 337.8 to 412.9 DDB 10/31/01 ersion 5.0 DRAFT in upport of GEOS-4.x. November 07, 2001 - The horizontal resolution of output products has been changed to 288x181. The prior value was 360x181. This change is reflected in Section 3 to describe the different time-averaging characteristics of the GEOS-4.x system output variables. In acteribations of the GEOS-4.x system output variables. In actrincular, 6-hourly time averages now have a			- added a discussion of the different horizontal and vertical	
Appendix A - Added a new table of pressure levels for CHM products and removed the table of sigma levels in Appendix C - Added a new table of pressure levels for CHM products and removed the table of sigma levels in Appendix C tables were changed from 0.1 to 0.2 because in 3D pressure products, 0.2 hPa is now the highest level, changed from 0.1 hPa in earlier documentation ersion 4.1 August 18, 1999 -Slight adjustment of variable content for tavg_cld_p, tavg3d tmp p, and tavg3d tmp p products. CCB 8/18/99 ersion 4.2 January 21, 2000 - Re-write Section 3 to clarify description of time-averaged Products. CCB 1/21/00 Added approval dates to revision history for Version 4.0 and Version 4.1. - Changed AM-1 to Terra throughout document. - Added approval dates to revision history for Version 4.0 and Version 4.1. DAO-1001v4.3) September 20, 2001 - In Table 6.1, adjusted the sizes of three products has been products. DILAPCLD changes from 150.1 to 112.6 DLLAPTIM changes from 373.8 to 412.9 ersion 5.0 DRAFT in pport of GEOS-4.x. November 07, 2001 - The horizontal resolution of output products has been change to reflected in Sections 4 and 6. - The prid origin has been change if from (180.0W,-90.0S) to (0.0W,-90.0S). This change is documentation for 4. -Adjustments were made to Section 3 to describe the different time-averaging characteristics of the GEOS-4.x system output variables. In particular, 6-hourty time averages now have a different averaging period. This will result in different averaging period. This will result in different averaging period			grid structures of the CHM products	
Appendix A - Added a new table of pressure levels for CHM products and removed the table of sigma levels in Appendix C - Added a new table of pressure levels for CHM products and removed the table of sigma levels in Appendix C - Added z in Appendix C backwards - Case 2001 v4.1) - Re-write Section 3 to clarify description of time-averaged CCB 1/21/00 products. - Changed AM-1 to Terra throughout document. - Added approval dates to revision history for Version 4.0 and Version 4.1. ersion 4.3 DAO-1001v4.3) September 20, 2001 - In Table 6.1, adjusted the sizes of three products to match CCB 5/17/00 the detailed descriptions in Section 6.2: DFLAXENG changes from 150.1 to 112.6 DLLAPCLD changes from 37.8 to 412.9 ersion 5.0 DRAFT in prior of GEOS-4.x. pyport of GEOS-4.x. </td <td></td> <td></td> <td>- Updated the description of First Look Analysis in</td> <td></td>			- Updated the description of First Look Analysis in	
- Âdded a new table of pressure levels for CHM products and removed the table of sigma levels in Appendix C - Added references for the data format - Levels 36 and 42 in Appendix C tables were changed from 0.1 to 0.2 because in 3D pressure products, 0.2 hPa is now the highest level, changed from 0.1 hPa in earlier documentation ersion 4.1 August 18, 1999 - Slight adjustment of variable content for tavg_cld_p, 2AO-1001v4.1) CCB 8/18/99 anuary 21, 2000 - Re-write Section 3 to clarify description of time-averaged products. - Changed AM-1 to Terra throughout document. - Added approval dates to revision history for Version 4.0 and Version 4.1. - Added approval dates to revision history for Version 4.0 and Version 4.1. DAO-1001v4.3) September 20, 2001 - In Table 6.1, adjusted the sizes of three products to match DLAPCLD changes from 66.7 to 58.4 DLLAPCLD changes from 15.0.1 to 112.6 DLLAPTMP changes from 337.8 to 412.9 ersion 5.0 DRAFT in pport of GEOS-4.x. November 07, 2001 - The horizontal resolution of output products has been changed to 288X18.1 The prior value was 360x181. This change is reflected in Sections 4 and 6. - The grid origin has been changed if or (180.0W,-90.0S) to (0.0W90.0S). This change is documented in Section 4. - Adjustments were made to Section 3 to describe the different time-averaging characteristics of the GEOS-4.x system output variables. In particular, 6-hourly time averages now have a different averaging period. This will result in different targe begin and end times for 3D pressure products.				
and removed the table of sigma levels in Appendix C - Added references for the data format - Levels 36 and 42 in Appendix C tables were changed from 0.1 to 0.2 because in 3D pressure products, 0.2 hPa is now the highest level, changed from 0.1 hPa in earlier documentation ersion 4.1 August 18, 1999 - Slight adjustment of variable content for tavg_cld_p, tavg3d tmp p. pand tavg3d tmp p. products. CCB 8/18/99 ersion 4.2 January 21, 2000 - Re-write Section 3 to clarify description of time-averaged products. CCB 1/21/00 ersion 4.3 January 21, 2000 - Re-write Section 3 to clarify description of time-averaged products. CCB 5/17/00 ersion 4.3 September 20, 2001 - In Table 6.1, adjusted the sizes of three products to match the detailed descriptions in Section 6.2: DFLAXENG changes from 66.7 to 58.4 DLLAPTMP changes from 307.8 to 412.9 port of GEOS-4.x. November 07, 2001 - The horizontal resolution of output products has been changed to 288x181. The prior value was 360x181. This change is reflected in Sections 4 and 6. DtB 10/31/01 ersion 4.1 Erdige changes from 0.4 and 6. - The grid origin has been changed from (-180.0W,-90.0S) to (0.0W,-90.0S). to (0.0W,-90.0S). to (0.0W,-90.0S). This change is documented in Section 4. -Adjustments were made to Section 3 to describe the different time-averaging characteristics of the GEOS-4.x system output variables. In particular, 6-hourly time averages now have a different averaging period. This will resul				
 Added references for the data format Levels 36 and 42 in Appendix C tables were changed from 0.1 to 0.2 because in 3D pressure products, 0.2 hPa is now the highest level, changed from 0.1 hPa in earlier documentation August 18, 1999 Slight adjustment of variable content for tavg_cld_p, CCB 8/18/99 AAO-1001v4.1) August 18, 1999 Slight adjustment of variable content for tavg_cld_p, tavg3d_tmp_p and tavg3d_tmp_p products. Changed AM-1 to Terra throughout document. 				
- Levels 36 and 42 in Appendix C tables were changed from 0.1 to 0.2 because in 3D pressure products, 0.2 hPa is now the highest level, changed from 0.1 hPa in earlier documentation CCB 8/18/99 ersion 4.1 August 18, 1999 - Slight adjustment of variable content for tavg_cld_p, tavg3d_tmp_p, and tavg3d_tmp_p products. CCB 8/18/99 pAO-1001v4.1) Ianuary 21, 2000 - Re-write Section 3 to clarify description of time-averaged CCB 1/21/00 products. - Changed AM-1 to Terra throughout document. - Added approval dates to revision history for Version 4.0 and Version 4.1. ersion 4.3 September 20, 2001 - In Table 6.1, adjusted the sizes of three products to match CCB 5/17/00 DAO-1001v4.3) September 20, 2001 - In Table 6.1, adjusted the sizes of three products to match CCB 5/17/00 ersion 5.0 DRAFT in upport of GEOS-4.x. November 07, 2001 - The horizontal resolution of output products has been changed from (-180.0W,-90.0S) to (0.0W,-90.0S). The grid origin has been changed from (-180.0W,-90.0S) to (0.0W,-90.0S). This change is reflected in Sections 4 and 6. - The grid origin has been changed from (-180.0W,-90.0S) to (0.0W,-90.0S). This change is documented in Section 4. - Adjustments were made to Section 3 to describe the different time-averaging characteristics of the GEOS-4.x. system output variables. In particular, 6-hourly time averages now have a different range begin and end times for 3D pressure products. - In section 6, variables that were nervoid from the GEOS-4.x system output variables that were previously product des			e	
from 0.1 to 0.2 because in 3D pressure products, 0.2 hPa is now the highest level, changed from 0.1 hPa in earlier documentation ersion 4.1 August 18, 1999 - Slight adjustment of variable content for tavg_cld_p, tavg3d tmp p, and tavg3d tmp p products. CCB 8/18/99 ersion 4.2 January 21, 2000 - Re-write Section 3 to clarify description of time-averaged products. - CCB 1/21/00 pAO-1001v4.2) January 21, 2000 - Re-write Section 3 to clarify description of time-averaged products. - Changed AM-1 to Terra throughout document. - Added approval dates to revision history for Version 4.0 and Version 4.1. - In Table 6.1, adjusted the sizes of three products to match the detailed descriptions in Section 6.2: DELAPCLD changes from 150.1 to 112.6 DAO-1001v4.3) DELAPCLD changes from 150.1 to 112.6 DLLAPCLD changes from 150.1 to 112.6 DLLAPCLD changes from 150.1 to 112.6 DLLAPCLD changes from 150.1 to 112.6 DDB 10/31/01 ensing to GEOS-4.x. - The horizontal resolution of output products has been change to 288x181. The prior value was 360x181. This change is a documented in Section 4. - Adjustments were made to Section 3 to describe the different time-averaging characteristics of the GEOS-4.x system output variables. In particular, 6-hourly time averages now have a different averaging period. This will result in different targe begin and end times for 3D pressure products. - In section 6, variables that were unavailable from the GEOS-4.x system were removed from DAS product descript				
now the highest level, changed from 0.1 hPa in earlier documentation documentation 2AO-1001v4.1) August 18, 1999 Slight adjustment of variable content for tavg_cld_p, tavg3d tmp p, and tavg3d tmp p products. ersion 4.2 DAO-1001v4.2) Auory 21, 2000 - Re-write Section 3 to clarify description of time-averaged products. - Changed AM-1 to Terra throughout document. - Added approval dates to revision history for Version 4.0 and Version 4.1. ersion 4.3 DAO-1001v4.3) September 20, 2001 - In Table 6.1, adjusted the sizes of three products to match the detailed descriptions in Section 6.2: DFLAXENG changes from 65.7 to 58.4 DLLAPCLD changes from 350.1 to 112.6 DLLAPTMP changes from 357.8 to 412.9 ersion 5.0 DRAFT in popt of GEOS-4.x. papert of GEOS-4.x. November 07, 2001 -The horizontal resolution of output products has been changed from (-180.0W,-90.0S) to (0.0W,-90.0S). This change is documented in Section 4. -Adjustments were made to Section 3 to describe the different time-averaging characteristics of the GEOS-4.x. system output variables. In particular, 6-hourly time averages now have a different averaging period. This will result in different may begin and end times for 3D pressure products. - In section 6, variables that were unavailable				
documentation documentation ersion 4.1 August 18, 1999 -Slight adjustment of variable content for tavg_eld_p, tavg3d tmp p, and tavg3d tmp p products. <u>1. Introduction</u>

This document describes the gridded output files from the version of the Goddard EOS Data Assimilation System (GEOS-4), which will support level-4 product generation. The intended audience is EOS instrument teams and other users of GEOS-4 products who need to write software to read GMAO products. The gridded data described in this document will be produced by the GEOS-4 Data Assimilation System (DAS) beginning in 2002 and delivered to the Goddard Distributed Active Archive Center (DAAC), part of the EOSDIS Core System (ECS). Two production suites will run daily, the first-look assimilation and the late-look assimilation (see Appendix A for definitions). To conserve space, a limited set of products will be generated by the first-look assimilation while the full set will be generated by the late-look assimilation. The product descriptions in Section 6 will identify which products are generated by each run. Information on the status of GMAO product generation can be found at <u>http://gmao.gsfc.nasa.gov/Operations/</u>.

2. Format and File Organization

GEOS- 4 files are in HDF-EOS format, which is an extension of the Hierarchical Data Format (HDF), Version 4 developed at the National Center for Supercomputing Applications (NCSA). Each GEOS- 4 file will contain a single HDF-EOS grid, which in turn contains a number of geophysical quantities that we will refer to as "fields" or "variables." Some files will contain 2-D variables on a lon/lat grid and some files will contain 3-D variables on the same lon/lat grid but with an additional vertical dimension. All files will have a time dimension with the number of times dependent on the file type (see Section 6). GEOS- 4 products always contain one complete day of data.

The variables are created using the **GDdeffield** function from the HDF-EOS GD API which implements them as HDF Scientific Data Set (SDS) arrays so they can be read with standard HDF routines. In addition to the geophysical variables, the files will have SDS arrays that define dimension scales (or coordinate variables). There will be two distinct scales for each dimension, which will insure that a wide variety of graphical display tools can interpret the dimension scales. In particular, there is a set of dimension scales that adhere to the COARDS conventions (see References).

ECS metadata and other information will be stored as global attributes.

2.1 Dimensions

GMAO HDF-EOS files will contain two sets of dimension scale (coordinate) information. One set of dimensions is defined using the **SDsetdimscale** function of the standard HDF SD interface. This set of scales will have an attribute named "units", set to an appropriate string defined by the COARDS conventions that can be used by applications to identify the dimension. The other set of dimension scales is created using the **GDdeffield/GDwritefield** functions as suggested in the ECS technical paper "Writing HDF-EOS Grid Products for Optimum Subsetting Services."

Table 2.1-1. Dimension Variables Contained in	n GMAO HDF-EOS Files
---	----------------------

Name	Description	Туре	units attribute
XDim:EOSGRID	longitude values	float32	degrees_east
YDim:EOSGRID	latitude values	float32	degrees_north
Height:EOSGRID	pressure levels	float32	millibar
(3D only)			
TIME:EOSGRID	minutes since first time in file	float32	minutes since YYYY-MM-DD HH:MM:SS
XDim	longitude values	float64	N/A
YDim	latitude values	float64	N/A
Height	pressure levels	float64	N/A
(3D only)			
Time	seconds since 1/1/93	float64	N/A

The 32-bit dimension variables have a "units" attribute that makes them COARDS-compliant, while the 64-bit dimension variables satisfy ECS requirements.

2.2 Variables

Variables are stored as SDS arrays even though they are defined with the HDF-EOS **GDdeffield** function. As a result, one can use the SD interface of the HDF library to read any variable from the file. The only thing one must know is the short name of the variable and the dimensions. You can quickly list the variables in the file by using common utilities such as *ncdump* or *hdp*. The latter utility is distributed from NCSA with the HDF library. A sample scan of one GMAO HDF-EOS file is shown below:

unix% hdp dumpsds -h DAS.flk.asm.tsyn3d_mis_p.GEOS400.1999052800.1999052818.V01 | grep Variable

Variable Name = UWND Variable Name = VWND Variable Name = HGHT Variable Name = TMPU Variable Name = SPHU Variable Name = RH Dimension Variable Name = XDim:EOSGRID Dimension Variable Name = YDim:EOSGRID Dimension Variable Name = Height:EOSGRID Dimension Variable Name = TIME:EOSGRID Variable Name = XDim Variable Name = YDim Variable Name = Height Variable Name = Time

In Section 8 we will present sample code for reading one or more data fields from this file. The short names for all variables in all GMAO data products are listed in the File Collections chapter, Section 6.

Each variable will have metadata attributes defined that may be useful. Many of these attributes are required by the COARDS conventions while others are for internal GMAO use. A listing of required attributes follows:

```
•FillValue (Type = 32-bit floating point or 16-bit signed integer)
   Any missing data will be filled with this value. This attribute is generated automatically by
   the HDF-EOS library. It will be of the same data type as the variable, thus could be 16-bit
   integer if the variable is packed.
•long name (Type = 8-bit signed char)
   Long name or description for this variable.
•units (Type = 8-bit signed char)
   The units of the geophysical variable (ud-units compliant).
•scale factor (Type = 32-bit floating point)
   If this variable is packed into 16-bit integers, this value would be multiplied to each data
   value to obtain the floating point number.
•add offset (Type = 32-bit floating point)
   For a packed variable, add this number after multiplying by the scale factor.
•missing value (Type = 32-bit floating point or 16-bit signed integer)
   For an unpacked variable, this is a floating-point representation of the fill value. For a
   packed variable, this is an integer representation of the fill value.
•fmissing value (Type = 32-bit floating point)
   Always a floating-point representation of the fill value.
•vmin (Type = 32-bit floating point)
   For internal GMAO use.
•vmax (Type = 32-bit floating point)
   For internal GMAO use.
```

Since we are not planning to pack the products intended for use by EOS instrument teams, attributes that support packing can be ignored. There may be other attributes that are meant for internal GMAO use that can also be ignored.

2.3 Global Attributes

In addition to SDS arrays containing variables and dimension scales, there is additional metadata stored in GMAO HDF-EOS files. Some of this metadata is required by the COARDS conventions, some is present due to ECS requirements, and some may exist as a convenience to internal GMAO users. A summary of global attributes that will exist in all GMAO files follows:

- •HDFEOSVersion Version of the HDF-EOS library used to create this file.
- •StructMetadata.0 This is the GridStructure metadata that is created by the HDF-EOS library.
- •CoreMetadata.0 The ECS inventory metadata.
- •ArchivedMetadata.0 The ECS archive metadata.
- •Title GEOS-DAS Version number and CVS tag.
- •Conventions Should always be set to "COARDS".
- •Source NASA Global Modeling and Assimilation Office, GEOS-DAS Version.
- •Contact Where to send questions.
- •History Version of DAS output library.

3. Synoptic vs Time-averaged Products

GEOS-4 gridded output files are identified as either synoptic or time-averaged products. Synoptic products are defined in Section 6.2 while time-averaged products are defined in Section 6.3. Additional synoptic products associated with the ozone assimilation are defined in Section 6.4. All synoptic products contain fields that are snapshots of a specific time. The synoptic products defined in Section 6.2 are generated directly from the atmospheric data analysis, which is performed every six hours at the four *synoptic times* (00 GMT, 06 GMT, 12 GMT, and 18 GMT). The "tsyn3d_mis_p" product has a time frequency of 6 hours, with data for each synoptic time. The "tsyn2d_mis_x" synoptic product has a time-frequency of 3 hours. The values for 03 GMT, 09 GMT, 15 GMT, and 21 GMT are time-interpolated from the synoptic times. This is done to make the product consistent with GEOS-3 products.

Time-averaged products are averaged over a 3-hour period for single level files or a 6-hour period for pressure level files. Single level products contain 8 times, with time-stamps of 01:30, 04:30, 07:30, 10:30, 13:30, 16:30, 19:30, and 22:30 GMT. Each time-stamp represents the center of a three-hour average, i.e., the first time in each file (time stamped with 01:30 GMT) represents the average between 00 GMT and 03 GMT. Time-averaged pressure level products contain 4 times with time-stamps of 03, 09, 15, and 21 GMT. Each time-stamp represents the center of a 6-hour average, i.e., the first time in the file (time-stamped with 03 GMT) represents an average between 00 GMT and 06 GMT. The valid range time of a daily file is 00 GMT to 00 GMT for both 3-hour and 6-hour average products. Note that the time-averaging of GEOS-4 products is different from the preceding GEOS-3 system (see diagram). Also note that eta-level products, added to the GEOS-4 product suite in 2004, have a different time-averaging convention. Please see Appendix E for details.

DAS Time-averaged Products

4. Grid Structure

Most GEOS-4 gridded output will be on a 1.25 x 1.0 degree global longitude-latitude horizontal grid (288,181). Products from the GMAO ozone assimilation (D4FAXCHM, D4FAPCHM, D4LAXCHM, D4LAPCHM) will be on a 2.5 x 2.0 degree longitude-latitude horizontal grid (144,91). The horizontal grid origin is the lower-left point and represents the geolocation (-180.0 W, -90.0 S). Latitude or longitude as a function of the index can be determined by:

lon = -180 + (x-1) * dxlat = -90 + (y-1) * dy

where dx = 1.25, dy = 1.0 except in the case of ozone products where dx = 2.5, dy = 2.0. For all parameters of each file, the gridpoints represent the center of a box, i.e., the value at (lon=5,lat=0) represents a box bounded by the points (lon=4.375,lat=-0.5), (lon=5.625,lat=0.5), (lon=5.625,lat=0.5), and (lon=4.375,lat=-0.5). Scalar values are the volume mean within the box.

The vertical structure of gridded products will have 3 different configurations: single-level (can be vertical averages), pressure levels, or eta levels (discussed in Appendix E). Single level data for a given variable appear as 3-dimensional fields (x,y,time) while pressure level data appear as 4-dimensional fields (x,y,z,time). Pressure level data will be output on 36 pressure levels (hPa), except for D4FAPCHM and D4LAPCHM which will have 42 pressure levels (see Appendix C). The appropriate grid structure will be specified both in the filename and the metadata.

GEOS-4 2D Grid Structure

5. File Naming Convention

Each GEOS-4 product will have a complete file name identified in the EOSDIS metadata as "LocalGranuleID". EOSDIS also requires abbreviated naming indices (8-character limit) for each Earth Science Data Type (ESDT). The ESDT indices convention is described in section 5.2.

5.1 File Name

The standard generic complete name for the assimilated GEOS- 4 configuration products will appear as follows:

DAS. config. mode. file type. expid. yyyymmdd hh. yyyymmdd hh. version

A brief description of the node fields appear below:

DAS:

Identifies output as a Data Assimilation System product.

config:

GEOS-4 will run in two different configurations. Appendix A describes these configurations. These are the strings that can appear in the config field.

flk - First Look *llk* - Late Look

mode:

GEOS-4 can run in different modes of operation, but the only mode used to support EOS instrument teams is "asm".

asm - Assimilation. Uses a combination of atmospheric data analysis and model forecasting to generate a time-series of global atmospheric quantities.

filetype:

The major filetypes are subdivided into file collections. Collections contain several fields with common characteristics. These collections are necessary to keep file sizes reasonable. Each filetype will contain the following information:

type/dimension_group_level

type/dimension:

There exist four possible type/dimension conventions for the DAS data products:

tsyn2d - 2-dimensional instantaneous fields at synoptic times (no time averaging). **tsyn3d** - 3-dimensional instantaneous fields at synoptic times (no time averaging).

- tavg2d 2-dimensional 3-hour time averaged fields, time-stamped at the center of the averaging period. For example, 04:30z output would be a 3z-6z time average).
- **tavg3d** 3-dimensional 6-hour time averaged fields, time-stamped at the center of the averaging period. For example, 3z output would be a 0z-6z time average.

group (for files which contain 2-dimensional fields):

str: stress related fields
eng: energy related fields
cld: cloud related fields
lsm: land surface model related fields
chm: chemical related fields (e.g. ozone)
mis: mixture of prognostic and diagnostic fields

group (for files which contain 3-dimensional fields):

mis: mixture of prognostic and diagnostic fields
mom: momentum profile fields
tmp: temperature profile fields
mst: moisture profile fields
cld: cloud profile related fields
trp: transport profile fields (e.g. eddy diffusivity)
chm: chemical profile fields

level: There are three possible level types for the DAS data:

x: single level data (surface, column integrated, single level)
p: pressure level data (see Appendix C for pressure levels)
e: ETA level data (see Appendix E)

expid:

Experiment Identification. The GEOS-4 DAS data sets will be labeled:

GEOS4##

where ## is a two-digit number. At the time of this document's release, the experiment identification is GEOS403. When GEOS-4 was initialized in operations, the experiment identification was GEOS401. When a reprocessing experiment is run over previously processed data periods or when a patched version is put into First-look or Late-look operations, we will increment the ## sequentially. Note that products produced by GEOS-3 had an experiment identification of AM101. These First-look and Late-look products were generated between January 1, 2000 and the operations date of GEOS-4 (October 1, 2002). As updated versions of the GEOS software are implemented in operations, the cvs tag in the metadata parameter "Title" will be

modified as well as the GMAO operations status web page (http://gmao.gsfc.nasa.gov/Operations/).

yyyymmddhh.yyyymmddhh:

This group defines the beginning date and synoptic time as well as the ending date and synoptic time.

yyyy - year string (e.g. "2002") **mm** - month string (e.g. "09" for September) **dd** - day of the month string (e.g. "10" for the tenth day of the month) **hh** - time (synoptic hour, e.g. "18" for 18:00 Greenwich Mean Time)

version:

This group defines the file version and takes the form V##. Under normal conditions ## will be 01. In the event of a processing error that requires a re-processing, this number will be incremented to identify the new version of this file. The file version will also be represented in the EOSDIS metadata as "LocalVersionID"

EXAMPLE:

DAS.flk.asm.tavg3d mom p.GEOS401.2002091500.2002091600.V01

This is an example of a DAS filename. It is a first look assimilation product. The data are 6-hour time averaged output on pressure levels (3 dimensions). The filetype consists of momentum fields. The valid range time for the file is Sep 15 at 00 GMT through Sep 16 at 00 GMT. There are 4 times, each representing a 6-hour average. The first average is from 00 GMT to 06 GMT. The last average is from 18 GMT to 00 GMT. See the discussion on time-averaged data in section 3 for more information.

5.2 Earth Science Data Types (ESDT) Name

To accommodate EOSDIS toolkit requirements, GEOS-4 complete filenames are associated to shorter or abbreviated indices in the ESDTs. EOSDIS requires a short (8 character) name for each ESDT. Below is the abbreviated naming convention for the GEOS-4 gridded ESDTs. The standard ESDT naming convention for the GEOS-4 gridded output will have the form:

DSPMVCCC

D: DAS identifier. Always **D**.

S: Major system number. For GEOS-4, 4.

P: Product

 $\mathbf{F} = \text{First Look}$

L = Late Look

M: Mode

A = Assimilation F = Forecast (currently not used)

V: Vertical Coordinate:

X = Single-Level P = Pressure E = ETA (Appendix E)

CCC: Filetype

MIS = misc ENG = energy LSM = land surface model STR = stress CHM = chemical CLD = cloud MOM = momentum MST = moisture TMP = temperature TRP = transport fields

Example:

Abbreviated Name: D4FAPMOM

Complete Name: DAS.flk.asm.tavg3d_mom_p.GEOS401.2002091500.2001091600.V01

6. File Collections

The contents of the Data Assimilation System file collections are described in sections 6.2, 6.3 and 6.4 while the sizes of each file are discussed in Section 6.1.

6.1 File Sizes

With the exception of chemistry (chm) products, GEOS-4 HDF files contain 1 day of data on a 1.25 degree x 1 degree lon-lat grid using 32-bit floating-point storage. Chm products are stored on a 2.5 degree by 2.0 degree lon-lat grid. See Appendix C for details about vertical levels. File sizes are approximate as metadata can cause slight variations in file size.

First-Look Filetype Group	Single Level (MB/day) (288,181,1) 8X/day	Pressure Levels (MB/day) (288,181,36) 4X/day	Eta Layers (MB/day) (288,181,55/24) 4X/day see appendix E

Total	132.2	759.7	912.6

$$* = (144, 91, 1)^{**} = (144, 91, 42)$$

6.2 Assimilated Synoptic Files

Below are the variables that are output into each syn file. These are instantaneous fields (no time averaging). The approximate size of each file below is determined by the following:

A x B x C x D x E x F = bytes/day

where:

- A: X-Dimension
- **B: Y-Dimension**
- C: Vertical dimension
- D: Number of fields in file
- E: Number of times in file
- F: Number of bytes per floating point number

The method for calculating sizes is the same in 6.2, 6.3, and 6.4.

NOTE: All HDF variable names are UPPERCASE.

•tsyn2d_mis_x (8 times per day)

6.4 Assimilated Chemistry Files

The following variables are generated by the GMAO Ozone Assimilation System. These are instantaneous fields (no time averaging). These products are produced from an offline (OL) ozone assimilation, which uses the wind data from the DAS as input. The ozone assimilation operates at a coarser resolution than the DAS, thus these products have horizontal resolution of 2.5 x 2 degrees. In addition, the vertical structure of the 3-D ozone products is different than other 3-D DAS products. See Appendix C for details.

The ozone mixing ratio fields in the tavg3d_chm_p product at the following levels: 1000, 975, 950, 925, 900, and 875 hPa are provided at the request of users. The ozone values provided at these levels are identical to the values at 850 hPa. Ozone data are assimilated between 850 and 0.2 hPa. No geophysical significance should be attributed to the 1000, 975, 950, 915, 900, and the 875 hPa levels.

OZONE	Ozone mixing ratio	ppmv

7. Metadata

GEOS-4 gridded output files will be associated with two types of metadata. Depending on the utility you use to access the file, one set of metadata will be read and the other ignored.

7.1 EOSDIS Metadata

If you are using the EOSDIS toolkit you will only use the EOSDIS metadata. EOSDIS identifies two major types of metadata, collection and granule.

Collection metadata are stored in a separate index file. This file is like a library card catalog. Each ESDT has a "card" that contains its unique collection attributes. Appendix B describes the ESDT collection metadata.

Granule metadata is the "table of contents" information stored on the data file itself. The EOSDIS granule metadata include:

- •file name (local granule ID)
- •grid structure

•number of times per day fields are stored in this file

- •number of vertical levels for each variable in this file
- •names of variables in this file
- •variable format (32-bit floating point, 16-bit integer, etc.)
- •variable storage dimensions
 - 2-d fields will have 3 storage dimensions, time, latitude and longitude
 - 3-d fields will have 4 storage dimensions, time, latitude, longitude and vertical levels
- •"missing" value for each variable
- •unpacking scale factor for each packed variable (see section 8)
- •unpacking off-set value for each packed variable (see section 8)

7.2 COARDS Metadata

If you use GRADS or FERRET to view GEOS-4 gridded data sets you will only use the COARDS metadata. These metadata will comply with the COARDS convention and include the following information:

- •space-time grid information (dimension variables)
- •variable long names (descriptions)

- •variable units
- •"missing" value for each variable
- •unpacking scale factor for each packed variable (see section 8)
- •unpacking off-set value for each packed variable (see section 8)

8. Sample Software

Presented here is software that illustrates using the standard HDF library or the ECS HDF-EOS library to read GEOS-4 products. The program shown below will accept as command line arguments a file name and a field name. It will open the file, read the requested field at the first time, compute an average for this field, and print the result to standard output. There are two versions of this program. The first version uses the HDF-EOS library to read the file. The second version uses the standard HDF library to read the file. Electronic copies of these programs can be obtained from the Operations section of the GMAO web page:

http://gmao.gsfc.nasa.gov/Operations/

```
/* This program demonstrates how to read a field from a GMAO HDF-EOS */
/* product using the HDF-EOS library. It will take a file name and */
/* field name on the command line, read the first time of the given */
/* field, calculate an average of that time and print the average. */
/* */
/* usage: avg <file name> <field name> */
/* */
/* Rob Lucchesi */
/* rlucchesi@GMAO.gsfc.nasa.gov */
/* 2/12/1999 */
#include "hdf.h"
#include "mfhdf.h"
#include <stdio.h>
#define XDIM 288
#define YDIM 181
#define ZDIM 36
main(int argc, char *argv[]) {
int32 sd id, sds id, status;
int32 sds index;
int32 start[4], edges[4], stride[4];
char *fname, *vname;
float32 data array[ZDIM][YDIM][XDIM];
float32 avg, sum;
int32 i,j,k;
int32 file id, gd id;
if (argc != 3) {
```

```
printf("Usage: avg <filename> <field> \n");
exit (-1);
}
fname = argv[1];
vname = argv[2];
/* Open the file (read-only) */

status = SDend (sd_id);
```

}

Appendix A. Types of Assimilation Configurations

First Look Assimilation. Atmospheric observations from satellites, balloons, aircraft, ships, and other sources are grouped into six-hour data windows and processed by the atmospheric analysis four times each day. The first look analysis will run 6 to 10 hours after the 4 analysis times (0Z, 6Z, 12Z, 18Z). It will run using whatever conventional and satellite observations are available at the data cut-off time. Even though first-look will run as 4 distinct segments, the GMAO will only distribute products that contain one complete day. Products produced from this and any other *assimilation* are a combination of output from the statistical analysis system and a short GCM forecast.

Late Look Assimilation. The software configuration is identical to the first look assimilation but, due to a delay of at least two weeks, a more complete set of input observations can be used. Unlike the first look analysis, the late look analysis will process one day at a time. The late look assimilation produces a greater volume of output products, since computational performance is not as critical.

Forecast/Simulation. This is a GCM forecast, with no insertion of atmospheric data via the analysis. The only outside data that enters the system are the boundary conditions, i.e., sea surface temperature and sea-ice concentration. Five-day forecasts are typically generated to support NASA field campaigns and to assess assimilation and forecast skill. Multi-year simulations are produced to investigate the climatology of the GCM. GMAO forecast products are not distributed to ECS and file formats are not discussed in this document.

Reprocessing. The GMAO will reprocess specified time periods since EOS-Terra launch using a recent version of the GEOS DAS software to support instrument team reprocessing requirements. A reprocessing run will use the Late Look assimilation file groupings and will use a version of GEOS DAS that is held constant through the reprocessing period. It is expected that new ECS ESDTs will be generated for each reprocessing run.

Reanalysis. The GMAO will occasionally run reanalysis experiments. Reanalysis is the same as reprocessing except the time period is often much longer and not necessarily part of the EOS period. Reanalysis experiments are often run using baseline versions of the GEOS DAS system to support a wide variety of research activities internal and external to the GMAO. Unique ESDTs will be generated for any reanalysis data distributed through ECS.

Appendix B. Collection Metadata

GEOS-4 collection metadata will contain the following. To view the ESDTs associated with GMAO products, which include collection metadata, see the GMAO Operations web page: http://gmao.gsfc.nasa.gov/Operations.

Appendix C. Vertical Grid Structure

Pressure level data will be output on the following 36 pressure levels for all 3-D products except chemistry:

Level	Pressure (hPa)	Level	Pressure (hPa)	Level	Pressure (hPa)
1	1000	13	600	25	50
2	975	14	550	26	40
3	950	15	500	27	30
4	925	16	450	28	20
5	900	17	400	29	10
6	875	18	350	30	7
7	850	19	300	31	5
8	825	20	250	32	3
9	800	21	200	33	2
10	750	22	150	34	1
11	700	23	100	35	0.4
12	650	24	70	36	0.2

Due to the scientific characteristics of the ozone assimilation, 3-D chemistry products (D4FAPCHM, D4LAPCHM) will have a different set of pressure levels:

Level	Pressure (hPa)	Level	Pressure (hPa)	Level	Pressure (hPa)
1	1000	15	500	29	50
2	975	16	450	30	40
3	950	17	400	31	30

12	650	26	100	40	1
13	600	27	85	41	0.4
14	550	28	70	42	0.2

Appendix D. Summary of differences between GEOS-3 and GEOS-4

In this section we summarize the differences between the GEOS-3 and GEOS-4 products. We will not discuss the scientific characteristics of the systems, but only the differences in format and content of the products. GEOS-3 products are generated using the GEOS-3 Data Assimilation System until October 1, 2002, after which products from the GEOS-4 Data Assimilation System will be produced. The same 21 products are produced from both systems, 8 from First-look and 13 from Late-look. The format of all products is the HDF-4 version of HDF-EOS. Details of the differences follow.

- •The horizontal resolution is different. The GEOS-3 resolution is 360x181. The GEOS-4 resolution is 288x181.
- •The averaging periods of time-averaged products has been changed. Averages are now between synoptic times rather than spanning them. For example, the first average in a 3D 6-hourly file from GEOS-4 is the period from 00 GMT to 06 GMT. The first average in a corresponding GEOS-3 file would be 21 GMT to 03 GMT. This has changed the effective range times of the GEOS-4 time-averaged products. See section 3 of this document for more information.

•The contents of most products changed.

otsyn2d_mis_x:

- ALBEDO and TPW removed but still available as time-averaged in tavg2d_eng_x
- VAVEU, VAVEV, and VAVET moved to tavg2d_eng_x, now time-averaged
- SNOW removed but still available as time-averaged in tavg2d_lsm_x
- GWET moved to tavg2d_eng_x as GWETTOP and GWETROOT, now timeaveraged
- TGROUND renamed to TSKIN
- TROPQ added

otsyn3d_mis_p:

- TKE removed
- OMEGA moved to tavg3d_mom_p, now time-averaged

otavg2d_eng_x:

- QICE, CT, VAVEQIAU, VAVEQFIL, and VAVETIAU removed
- VAVEU, VAVEV, VAVET, GWETTOP, and GWETROOT added (formerly in tsyn2d_mis_x)
- TGROUND renamed to TSKIN
- PRECL added
- PARDR and PARDF added (formerly in tavg2d_lsm_x)

otavg2d_str_x:

GWDUT, GWDVT, CU, and PIAU removed

Z0 split into Z0H and Z0M

• PBL changed to PBLH (units changed from hPa to m)

otavg2d_lsm_x:

SNOWFALL, GREEN, and DLWDTC removed

PARDR and PARDF moved to tavg2d_eng_x

otavg2d_cld_x:

• TAULOW, TAUMID, TAUHI, CLDTMP, and CLDPRS removed

otavg3d_cld_p:

CLDRAS removed

TAUCLD split into TAUCLI and TAUCLW

otavg3d_mom_p:

- RFU, RFV, UIAU, VIAU, DUDT, and DVDT removed
- OMEGA was added (formerly in tsyn3d_mis_p)

otavg3d_mst_p:

DQLS, QIAU, QFILL, and DQDT removed

otavg3d_tmp_p:

•TURBT, MOISTT, DTLS, RADLW, RADSW, RFT, GWDT, TIAU, DTDT, LWCLR, and SWCLR removed

- •Due to these changes, there are differences in the daily file sizes.
- •The filename convention was changed slightly. *AM1* was changed to *GEOS4*. The hour in the filename is different for time-averaged products due to the difference of time ranges mentioned above. See section 5 for more details about the file naming convention.
- •New ESDTs were defined for GEOS-4. The names are listed in section 6 of this document. For First-look the ESDT names now start with *D4F* and for Late-look *D4L*. For GEOS-3 the names started with *DFL* and *DLL*.
- •The data contained in the tsyn2d_mis_x product is 3-hourly, however the source data from GOES-4 is 6-hourly. The interim times are computed by time interpolating between synoptic times. This is done to provide consistency with the corresponding GEOS-3 product. See section 3 for more information.

Appendix E: Additional products on eta vertical coordinates

A set of First-look (FLK) and Late-look (LLK) products defined on the GEOS-4 vertical coordinate grid (eta) will be produced starting in spring 2004. Eta coordinates are generically known as atmosphere hybrid sigma pressure coordinates. The two eta-layer products will be daily files with four 6-hour time-averages for each variable. These files are targeted for users involved in chemical transport work, but may be useful to a wider audience. The *tavg3d_mis_e* product is defined for 55 vertical layers, from the highest layer of the GCM (0.015 hPa) to the layer adjacent to the surface. The *tavg3d_trp_e* product is defined for only the lowest 24 GCM eta layers because the variables included vanish above the tropopause. The time period for each six-hour average will be centered on one of the 4 synoptic times, i.e., 00 GMT will represent the average from 21 GMT to 03 GMT. This is different than the pressure products, described in section 6, which span the periods between synoptic times. For more information, please see the diagram at the end of this appendix.

The GEOS-4 eta coordinate system can be described by the following equation:

$$p(i,j,k,t) = a(k) + b(k)*ps(i,j,t)$$

where for a given time *t*, *p* is the pressure at the coordinates *i*,*j*,*k* and *a*(*k*) and *b*(*k*) are components of the hybrid coordinate at the layer edge *k*. To find the average *p* for a layer, one would average *p* at the edges *k* and *k*+1. ps(i,j,t) is the surface pressure at the horizontal gridpoint (*i*,*j*) and time *t*. *a*(*k*) and *b*(*k*) at 56 layer edges (25 edges for the 24 layer product) are stored as global metadata values in each eta product file. They are also listed in a table near the end of this appendix. For $tavg3d_mis_e$, when k=1, p = 1.0 Pa and when k=56, p=ps. For $tavg3d_trp_e$, when k=1, p=3,381 Pa and when k=56, p=ps.

•tavg3d mis e (4 times per day)

ZMMU	Updraft mass flux - Z&M convection	Pa/s					
*- These var	iables are also available in other GEOS-4 surface of	or pressure products, but in the					
eta products	s we use standard SI units or derivations. In particu	llar, tendency terms in					
pressure lev	pressure level products are expressed as rates of change per day, while the eta products are						
per second.	per second. Moisture concentrations are expressed here as kg/kg, while the pressure						
products us	e g/kg. Surface pressure is expressed in Pa instead of	of hPa. Mass flux terms are					
expressed a	s Pa/s.						

Filenames of the eta products conform to the conventions described in section 5 of this document. The beginning and ending times will be slightly different than for the pressure products due to the differences in the time-averaging period. Here is an example of filenames from First-look.

DAS.flk.asm.tavg3d_mis_e.GEOS403.2003070121.2003070221.V01 DAS.flk.asm.tavg3d_trp_e.GEOS403.2003070121.2003070221.V01

The following table contains ak and bk pairs for each layer edge k. There are 56 layer edges that define 55 layers. Note that for the 24 layer $tavg3d_trp_e$ product, there are 25 layer edges and the k values are denoted with ()s. These arrays can be found as floating point global metadata attributes in each eta product file.

Figure 1 - This is a graphical representation of the averaging periods for GEOS-4 3D time-averaged products. Note that eta-layer products are centered on synoptic times while pressure-level products span the range between synoptic times.
