Preface

The Clouds and the Earth's Radiant Energy System (CERES) Data Management System (DMS) supports the data processing needs of the CERES Science Team research to increase understanding of the Earth's climate and radiant environment. The CERES Data Management Team works with the CERES Science Team to develop the software necessary to support the science algorithms. This software, being developed to operate at the Langley Atmospheric Sciences Data Center (ASDC), produces an extensive set of science data products.

The DMS consists of 12 subsystems; each subsystem contains one or more Product Generation Executables (PGEs). Each subsystem executes when all of its required input data sets are available and produces one or more archival science products.

This Operator's Manual is written for the data processing operations staff at the Langley ASDC by the Data Management Team responsible for this Subsystem. This document describes all PGEs for this Subsystem and contains the Runtime Parameters, Production Request Parameters, the required inputs, the steps used to execute, and the expected outputs for each of these PGEs. In addition, all subsystem error messages and subsequent actions required by the ASDC operations staff are included.

Acknowledgment is given to Tammy Ayers of Science Systems and Applications, Inc. (SSAI) for her support in the preparation of this document and to Maria Vallas Mitchum, NASA Langley Research Center, and Sandra K. Nolan, SAIC, for structuring the manual guidelines and organization.

Introduction

The Clouds and the Earth's Radiant Energy System (CERES) is a key component of the Earth Observing System (EOS) program. The CERES instrument provides radiometric measurements of the Earth's atmosphere from three broadband channels: a shortwave channel (0.3 - 5 μm), a total channel (0.3 - 200 μm), and an infrared window channel (8 - 12 μm). The CERES instruments are improved models of the Earth Radiation Budget Experiment (ERBE) scanner instruments, which operated from 1984 through 1990 on the National Aeronautics and Space Administration's (NASA) Earth Radiation Budget Satellite (ERBS) and on the National Oceanic and Atmospheric Administration's (NOAA) operational weather satellites NOAA-9 and NOAA-10. The strategy of flying instruments on Sun-synchronous, polar orbiting satellites, such as NOAA-9 and NOAA-10, simultaneously with instruments on satellites that have precessing orbits in lower inclinations, such as ERBS, was successfully developed in ERBE to reduce time sampling errors. CERES continues that strategy by flying instruments on the polar orbiting EOS platforms simultaneously with an instrument on the Tropical Rainfall Measuring Mission (TRMM) spacecraft, which has an orbital inclination of 35 degrees. In addition, to reduce the uncertainty in data interpretation and to improve the consistency between the cloud parameters and the radiation fields, CERES includes cloud imager data and other atmospheric parameters. The TRMM satellite carries one CERES instrument while the EOS satellites carry two CERES instruments, one operating in a fixed azimuth plane scanning mode (FAPS) for continuous Earth sampling and the other operating in a rotating azimuth plane scan mode (RAPS) for improved angular sampling.

Document Overview

This document, CERES Cloud Retrieval and Convolution Subsystems 4.1 through 4.4 Release 4 Operator's Manual is part of the CERES Subsystems 4.1 through 4.4 Release 4 delivery package provided to the Langley Atmospheric Sciences Data Center (ASDC). It provides a description of the CERES Cloud Retrieval and Convolution Release 4 software and explains the procedures for executing the software. A description of acronyms and abbreviations is provided in Appendix A, a comprehensive list of messages that can be generated during the execution of PGEs CER4.1-4.0P1, CER4.1-4.1P1, CER4.1-4.1P2, CER4.1-4.1P3, CER4.1-4.1P4, CER4.1-4.1P5, CER4.1-4.2P1, CER4.1-4.2P2, CER4.1-4.2P3, CER4.1-4.3P1, CER4.1-4.3P2 and CER4.1-4.4P1 are contained in Appendix B, an Input File Listing is provided in Appendix C, and a sample environment script along with details on handling multiple instrument processing is provided in Appendix D.

This document is organized as follows:

Subsystem Overview

CER4.1-4.0P1 - Snow and Ice Processor

The CERES "Determine Cloud Properties, TOA and Surface Fluxes" Subsystem (Subsystem 4) requires snow and ice information on a ten-minute grid. This information, received from the National Snow and Ice Data Center, is prepared on a 25-km equal area grid. This PGE re-projects the snow and ice data onto a 10 minute equal-angle grid.

CER4.1-4.1P1 - Imager Clear-Sky Determination and Cloud Detection, Cloud Pressure Retrieval, Cloud Optical Property Retrieval, and Convolution of Imager Cloud Properties with CERES Footprint Point Spread Function Subsystem 4.1 through 4.4 Main Processor

The CERES "Determine Cloud Properties, TOA and Surface Fluxes" Subsystem (Subsystem 4) has been divided into two separate subsystems. They are the "Determine Cloud Properties" Subsystem and the "Determine TOA and Surface Fluxes" Subsystem. The "Determine Cloud Properties" Subsystem has been further divided into two major components. Separate sets of executable code have been developed for each component, but they are contained within one PGE. The first major component (Cloud Retrieval) combines the functions described in Algorithm Theoretical Basis Documents (ATBDs) 4.1, 4.2, and 4.3, and provides the identification of clear-sky and clouds (cloud mask), cloud layer pressure determination, and cloud optical properties for the cloud imager data on a per-pixel basis. For convenience throughout the rest of this document, this component is referenced as "cloud retrieval." The second major component is Convolution of Imager Cloud Properties with CERES Footprint Point Spread Function (PSF), corresponding to ATBD 4.4. For convenience throughout the rest of this document, this component is referenced as "convolution." Convolution accepts the pixel-level cloud data produced by the cloud retrieval component of the Determine Cloud Properties Subsystem and convolves it with the CERES footprint field-of-view (FOV) data obtained from the Instrument Earth Scans (IES) datasets to produce an intermediate Single Scanner Footprint (SSFI) output data product. The "Determine TOA and Surface Fluxes" Subsystem (ATBDs 4.5 and 4.6) completes Subsystem 4.0 and the SSF

archive product by producing fluxes at the top of the atmosphere (TOA) and at the surface and is covered in another operations manual.

CER4.1-4.1P2 - Imager Clear-Sky Determination and Cloud Detection, Cloud Pressure Retrieval, Cloud Optical Property Retrieval, and Convolution of Imager Cloud Properties with CERES Footprint Point Spread Function Subsystem 4.1 through 4.4 Terra-MODIS Main Processor

This version of the PGE was designed to handle changes in cloud retrieval and convolution processing for the Moderate-Resolution Imaging Spectroradiometer on the Terra satellite without requiring the VIRS-TRMM processing to be modified.

CER4.1-4.1P3 - Imager Clear-Sky Determination and Cloud Detection, Cloud Pressure Retrieval, Cloud Optical Property Retrieval, and Convolution of Imager Cloud Properties with CERES Footprint Point Spread Function Subsystem 4.1 through 4.4 Aqua-MODIS Main Processor

This version of the PGE was designed to handle changes in cloud retrieval and convolution processing for the Moderate-Resolution Imaging Spectroradiometer on the Aqua satellite without requiring the VIRS-TRMM or Terra-MODIS processing to be modified.

CER4.1-4.1P4 - Imager Clear-Sky Determination and Cloud Detection, Cloud Pressure Retrieval, Cloud Optical Property Retrieval, and Convolution of Imager Cloud Properties with CERES Footprint Point Spread Function Subsystem 4.1 through 4.4 Terra-MODIS Collection 005 Main Processor

This version of the PGE was designed to handle changes in cloud retrieval and convolution processing for the Moderate-Resolution Imaging Spectroradiometer on the Terra satellite Collection 005 data products without requiring the Terra-MODIS Collection 004 processing to be modified.

CER4.1-4.1P5 - Imager Clear-Sky Determination and Cloud Detection, Cloud Pressure Retrieval, Cloud Optical Property Retrieval, and Convolution of Imager Cloud Properties with CERES Footprint Point Spread Function Subsystem 4.1 through 4.4 Aqua-MODIS Collection 005 Main Processor

This version of the PGE was designed to handle changes in cloud retrieval and convolution processing for the Moderate-Resolution Imaging Spectroradiometer on the Aqua satellite Collection 005 data products without requiring the Aqua-MODIS Collection 004 processing to be modified.

CER4.1-4.2P1 - Imager Clear Sky Map Update and Daily QC Processor

The CERES "Determine Cloud Properties, TOA and Surface Fluxes" Subsystem (Subsystem 4) has the requirement to detect clouds from the imager radiances. One detection method compares the current pixel reflectance to a historical map of reflectance occurring under clear sky conditions.

A similar procedure using clear sky brightness temperature is also used. A data product of imager albedo and brightness temperatures for clear pixels is produced for each execution of CER4.1-4.1P1. At regularly scheduled intervals, the hourly information is compared to the historical file. Any daily value that are significantly different from the running average contained in the historical file are updated. To facilitate algorithm validation, daily QC products are produced. This PGE takes as input the hourly QC reports produced by CER4.1-4.1P1, CER4.1-4.1P2, CER4.1-4.1P3, CER4.1-4.1P4, or CER4.1-4.1P5.

CER4.1-4.2P2 - Imager Clear Sky Map Update Processor

The CERES "Determine Cloud Properties, TOA and Surface Fluxes" Subsystem (Subsystem 4) has the requirement to detect clouds from the imager radiances. One detection method compares the current pixel reflectance to a historical map of reflectance occurring under clear sky conditions. A similar procedure using clear sky brightness temperature is also used. A data product of imager albedo and brightness temperatures for clear pixels is produced for each execution of CER4.1-4.1P2, CER4.1-4.1P3, CER4.1-4.1P4, or CER4.1-4.1P5. At regularly scheduled intervals, the hourly information is compared to the historical file. Any daily value that are significantly different from the running average contained in the historical file are updated.

CER4.1-4.2P3 - Collection 005 Daily QC Processor

To facilitate algorithm validation, daily QC products are produced. This PGE takes as input the hourly QC reports produced by CER4.1-4.1P4 or CER4.1-4.1P5 (MODIS Collection 005 data).

CER4.1-4.3P1 - Monthly QC Processor

To facilitate algorithm validation, monthly QC products are produced. This PGE takes as input the daily QC reports produced by CER4.1-4.2P1.

CER4.1-4.3P2 - Collection 005 Monthly QC Processor

To facilitate algorithm validation, monthly QC products are produced. This PGE takes as input the daily QC reports produced by CER4.1-4.2P3 (MODIS Collection 005).

CER4.1-4.4P1 - Subset Imager Data

This PGE takes as input an imager data file and produces a file that contains only those scanlines which nadir pixel passes over a CERES Validation Region. The list of CERES Validation Regions is contained in CERESlib.

1.4 Operating Procedures

The PGE CER4.1-4.0P1 production script, **Run.CER4.1-4.0P1**, references a Process Control File (PCF) which contains the correct file names and paths for the PGE. This PCF can be created by first sourcing the cloud retrieval-specific environment script, **CER4.1-4.env** then executing the PCF generator **CER4.1-4.0P1.PCFGen**.

1.4.1 How to Generate the PCF File

The PC file generator **CER4.1-4.0P1.PCFGen** requires three command-line arguments: 4-digit year (YYYY), 2-digit month (MM), 2-digit day (DD).

At the command-line (>) type:

> cd $CERESHOME/clouds/bin
> source $CERESHOME/clouds/bin/CER4.1-4.env
> **$CERESHOME/clouds/bin/CER4.1-4.0P1.PCFGen YYYY MM DD**

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.0P1_PCFin_$SS4_0_$PS4_0_$CC4_0P1.YYYYMMDD and
CER4.1-4.0P1_PCF_$SS4_0_$PS4_0_$CC4_0P1.YYYYMMDD.

1.4.2 How to Execute the Main Processor

Execute the production script by typing the script name, **Run.CER4.1-4.0P1**, followed by the fully specified path name for the PCFile.

At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>$CERESHOME/clouds/bin/Run.CER4.1-4.0P1 $CERESHOME/clouds/rcf/
CER4.1-4.0P1_PCF_$SS4_0_$PS4_0_$CC4_0P1.YYYYMMDD

1.4.3 Special Case Considerations

None.

1.4.4 Special Reprocessing Instructions

All output files are opened with Status = NEW in Subsystem 4.1 through 4.4 software. The output from previous runs must be removed before reprocessing. A cleanup script has been provided as a convenience. It is to be run prior to reprocessing.
At the command-line (>) type:

>cd $CERESHOME/clouds/bin
>$CERESHOME/clouds/bin/Run.CER4.1-4.Cleanup $CERESHOME/clouds/rcf/CER4.1-4.0P1_PCF_$SS4_0_$PS4_0_$CC4_0P1.YYYYMMDD

The cleanup script uses the generated PCFile to identify files to be removed. If no PCFile exists, one is generated.

1.5 Execution Evaluation

1.5.1 Exit Codes

The processor CER4.1-4.0P1 terminates using the CERES-defined EXIT CODES for the Langley TRMM Information System (LaTIS) as seen in Table 1-6. Other Exit Codes may appear from the program, which may be the result of a system, compiler, or Toolkit related error. In these cases, contact the responsible person (see Table 1-1) for assistance.

Table 1-6. Exit Codes for CER4.1-4.0P1

Exit Code	Definition	Action
0	Normal Exit	Proceed normally
Other	Failure	

1.5.2 Screen Messages

When running the production script, Run.CER4.1-4.0P1, one of three possible screen messages will appear, a system problem notwithstanding. They are shown in Table 1-7.

Table 1-7. Screen Messages for CER4.1-4.0P1

Message	Implication
Processing Complete	Successful completion of the PGE.
Problem executing Exe.CER4.1-4.0P1.SnowIce	A problem with the execution
Problem with NSIDC Data retrieval	A problem reading the NSIDC data set. Check for the existence of the input file. Stage it, if absent.

1.5.3 Log and Status Files Results

The Log files contain all error and/or status messages produced by the PGE. The files are located in directory: **$CERESHOME/clouds/data/runlogs**.

1.5.3.1 Report Log File: CER4.1-4.0P1_LogReport_$SS4_0_$PS4_0_$CC4_0P1.YYYYMMDD

The log report file contains informational messages for the PGE. They indicate progression through critical steps of the code or use of contingency code that will handle data problems. They point to algorithms that were executing when program problems occur. A comprehensive list of these messages, that can be generated during the execution of the PGE, is contained in Appendix B.

1.5.3.2 Status Log File: CER4.1-4.0P1_LogStatus_$SS4_0_$PS4_0_$CC4_0P1.YYYYMMDD

The Status Log File contains all messages created by the Toolkit and fatal processing messages. If an abnormal exit is encountered by the PGE, this file should be examined for '_F_', fatal message type. The responsible person should be advised.

1.5.3.3 User Log File: CER4.1-4.0P1_LogUser_$SS4_0_$PS4_0_$CC4_0P1.YYYYMMDD

The User Log File is not used at this time, but exists to satisfy the Toolkit requirements. Typically the _U_ and _N_ (User information and Notice) will be written to User Log File and Status Log File.

1.5.3.4 ShmMem File: CER4.1-4.0P1_ShmMem

The ShmMem File exists to satisfy the Toolkit requirements and is not actively used by CER4.1-4.0P1.

1.5.4 Solutions to Possible Problems

As mentioned in Section 1.4.4, all output files are opened with Status = NEW in Subsystem 4.1 software. Prior to any reprocessing, please run the Cleanup script.

1.5.5 Conditions for Subsystem and/or Target PGE(s) Terminal Failure (Halt all further processing)

a. Subsystem Termination

   There are no foreseeable Subsystem terminating conditions at this time. If one day fails, continue processing the next day.

b. Target PGE Termination

   If any of the files are missing from the expected output, this condition must terminate all further Target PGE processing for that day.

1.6 Expected Output Dataset(s)

The expected Output Datasets are listed below for each instance of the PGE. This PGE is expected to process 31 times, maximum, in a 31 day month.

2.2.2 Environment Script Requirements

One environment script, named 'CER4.1-4.env', is required and contains the following parameters:

CC1 - Configuration Code for IES, see CM Database
CC4_0P1 - Configuration Code for Snow and Ice Map, see CM Database
CC4_1P1 - Configuration Code for CER4.1-4.1P1, see CM Database
CC4_2 - Configuration Code for Clear Sky Map, see CM Database and Production Request
CC12 - Configuration Code for MOA, see CM Database
CV - Set to y when CloudVis Hourly File is produced, set to n otherwise
DATA4_1 - Data SCCR# for Clouds, see CM Database
IMAG - Imager Short Name (VIRS)
INST - CERES Instrument Short Name (PFM, SIM)
PRODUCTION - Set to "YES" when run on a production computer
PS1 - Production Strategy for IES, see Production Request
PS4_0 - Production Strategy for Snow and Ice Map, see Production Request
PS4_1 - Production Strategy for CER4.1-4.1P1, see Production Request
PS4_2 - Production Strategy for Clear Sky Map, see Production Request
PS12 - Production Strategy for MOA, see Production Request
SAT - Satellite Short Name (TRMM)
SS1 - Sampling Strategy for IES, see Production Request
SS4_0 - Sampling Strategy for Snow and Ice Map, see Production Request
SS4_1 - Sampling Strategy for CER4.1-4.1P1, see Production Request
SS4_2 - Sampling Strategy for Clear Sky Map, see Production Request
SS4_4 - Sampling Strategy for CER4.1-4.1P1, see Production Request
SS12 - Sampling Strategy for MOA, see Production Request
SW4_1 - Software SSCR # for Clouds, see CM Database

NOTE: In sequential processing, CC4_2, PS4_2, and SS4_2 would be the same as CC4_1P1, PS4_1, and SS4_1 respectively. On the first data day following a configuration code change, CC4_2 would have the configuration code used on the previous day. The other variables would not change.

NOTE: If hourly CloudVis processing is required, then set variable to y (yes) otherwise set to n (no). CloudVis Subset processing will not be affected by changes to CV variable.

During nonsequential processing, CC4_2, PS4_2, and SS4_2 will contain the values for the best Clear Sky Map available. This information may be supplied through the Production Request or obtained from the responsible person in Table 1-1. These would be different from CC4_1P1, PS4_1, and SS4_1.

Refer to the CERES internal paper (Reference 1) for a detailed description of the CERES environment parameters.

Also see Appendix D of this document for a detailed description of the Subsystem specific environment.

2.2.3 Execution Frequency

Hourly (1/hr/sat) - This PGE is to be processed once per data-hour, for a maximum total of 744 hours per month per satellite.

2.2.4 Memory/Disk Space/Time Requirements

Table 2-4. Memory/Disk Space/Time Requirements for CER4.1-4.1P1

PGE Number	PGE Name	Platform	Total Run Time (HR:MN:SEC)	Memory (MB)	Disk Storage (MB)
CER4.1-4.1P1	Cloud Property Retrieval and Convolution	TRMM	3:11:00	286	425
		Subset TRMM	0:30:00	280	60

2.2.5 Restrictions Imposed in Processing Order

Please process each given day in sequential order. For individual hours within a given day order is unimportant. That is, process all hours from January 1, 1998 before processing January 2, 1998. This allows for updating the Clear Reflectance History (CRH) (CER4.1-4.2P1) for a given day which is input into the next day's PGEs.

NOTE: For TRMM Edition2 processing, the requirement to process each day in sequence is removed from January 1, 1998 to August 31, 1998 and March, 2000.

2.3 Processor Dependencies (Previous PGEs, Ingest Data,..)

2.3.1 Input Dataset Name (#1): ECID

2.3.1.1 VIRS Data

a. Directory Location/Inputs Expected (Including .met files, header files, etc.):

$CERESHOME/clouds/data/input/VIRS/
1B01.YYMMDD.OOOO.CC_V.HDF, and if needed
1B01.YYMMDD.OOOP.CC_V.HDF (see item f)

1. Mandatory/Optional: **This file is mandatory.**
2. Time Related Dependency:

   The DataDate must match the Runtime Parameters: YYYY,MM,DD
   OOOO represents the orbit number of the first VIRS file, OOOP represents the next orbit of VIRS data, CC_V is the VIRS version number.
3. Waiting Period: **None. Process when all input data are available.**

b. Source of Information (Source is PGE name or Ingest Source):

INGEST Source: Goddard DAAC -or-
PGE Source: CER4.1-4.4P1

c. Alternate Data Set, if one exists (maximum waiting period): **N/A**

d. File Disposition after successful execution: **Remove**

e. Typical file size (Mb): **91.9**

f. Special Requirements: There is a preprocessor script that reads the start and end time of the file and assigns them a file link to the hours that are covered by the orbit. This information is used to place the correct VIRS file name in the PCF file. There are instances where the entire hour including overlap are included in a single orbit. In these cases, only one VIRS file will be included in the PCF. The renaming steps for Subsetted VIRS files are identical.

To Rename the VIRS files, execute the following sequence of commands.

> source $CERESHOME/clouds/bin/CER4.1-4env
> $CERESHOME/clouds/bin/Run.CER4.1-4.0P1.RenameVIRS <filename>

where <filename> is the fully specified pathname of the VIRS file to be renamed. The links created by the rename program needs to be removed when transitioning from full VIRS files to subsets. Only the VIRS full or subset file being used should be in the directory.

e. Typical file size (mb): **43.8**

f. Special Requirements: MOA data are produced as six hour files named according to their start hour. To process an hour that is not hour 00, 06, 12, or 18, operators must stage the two bracketing MOA files, getting the file for hour 00 from 'tomorrow' if necessary.

e. Typical file size (mb): **18.6**

f. Special Requirements: In sequential processing (when the previous day has been run using the same configuration code, production strategy and sampling strategy, CC4_2, PS4_2, and SS4_2 would be the same as CC4_1P1, PS4_1, and SS4_1 respectively. **On the first data day following a configuration code change during the same production and sampling strategy, CC4_2 would have the configuration code used on the previous data day.** The other variables would not change. **During nonsequential processing and the first data day of sequential processing, CC4_2, PS4_2, and SS4_2 will contain the values for the best Clear Sky Map available. 2.4 Operating Procedures

The PGE CER4.1-4.1P1 production script, **Run.CER4.1-4.1P1**, references a Process Control File (PCF) which contains the correct file names and paths for the PGE. This PCF can be created by first sourcing the cloud retrieval-specific environment script, **CER4.1-4.env** then executing the PCF generator **CER4.1-4.1P1.PCFGen**.

2.4.1 How to Generate the PCF File

The environment script requires two optional command-line arguments: 1-digit satellite (X) and character string prefix to production strategy (N). The default satellite is TRMM, 1-NOAA09, 2-TRMM, and 3-Terra. The prefix is usually Subset that generates special processing where only data in CERES validation regions is used. The PCF generator, **CER_4.1-4.1P1.PCFGen**, requires four command-line arguments: 4-digit year (YYYY), 2-digit month (MM), 2-digit day (DD), and 2-digit hour-of-day (HH).

At the command-line (>) type:

> source $CERESHOME/clouds/bin/CER4.1-4.env X N
> **$CERESHOME/clouds/bin/CER4.1-4.1P1.PCFGen YYYY MM DD HH**

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.1P1_PCFin_$SS4_4_$PS4_1_$CC4_1P1.YYYYMMDDHH and
CER4.1-4.1P1_PCF_$SS4_4_$PS4_1_$CC4_1P1.YYYYMMDDHH

2.4.2 How to Execute the Main Processor

Execute the production script by typing the script name, **Run.CER4.1-4.1P1**, followed by the PCF file name including directory.

At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>$CERESHOME/clouds/bin/Run.CER4.1-4.1P1 $CERESHOME/clouds/rcf/
CER4.1-4.1P1_PCF_$SS4_4_$PS4_1_$CC4_1P1.YYYYMMDDHH

2.4.3 Special Case Considerations

There is a need to process imager data even when CERES data (IES) is not available. The production request will indicate that CERES instrument be set to NONE. The SSFI, FQC, and FQCI files will not be produced for these cases. The exit code will be 202, because convolution would not have processed successfully.

Other special case considerations will be handled on a case-by-case basis, where special instructions will accompany each special request.

2.4.4 Special Reprocessing Instructions

All output files are opened with Status = NEW in Subsystem 4.1 through 4.4 software. The output from previous runs must be removed before reprocessing. A cleanup script has been provided as a convenience. It is to be run prior to reprocessing.

At the command-line (>) type:

>cd $CERESHOME/clouds/bin
>$CERESHOME/clouds/bin/Run.CER4.1-4.Cleanup $CERESHOME/clouds/rcf/
CER4.1-4.1P1_PCF_$SS4_4_$PS4_1_$CC4_1P1.YYYYMMDD

The cleanup script uses the PCFile from the PCFile Generator to identify files to be removed.

2.5 Execution Evaluation

2.5.1 Exit Codes

The processor CER4.1-4.1P1 terminates using the CERES-defined EXIT CODES for the Langley TRMM Information System (LaTIS) as seen in Table 2-5. Other Exit Codes may appear from the program, which may be the result of a system, compiler, or Toolkit related error. In these cases, contact the responsible person (see Table 1-1) for assistance.

Table 2-5. Exit Codes for CER4.1-4.1P1(1 of 2)

Exit Code	Definition	Action
0	Normal Exit	Proceed Normally
99	Failure	Check Imager input files for compression or corruption.
137	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B).

Table 2-5. Exit Codes for CER4.1-4.1P1(2 of 2)

Exit Code	Definition	Action
200	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). Check to ensure IES was staged and imager file was produced. This includes the case when no matching imager data was available for CERES footprints.
201	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). IES was not staged for convolution.
202	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). Usually indicates a foreseeable input error.
203	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B).

2.5.2 Screen Messages

Screen Messages are not normally encountered when running the production script Run.CER4.1-4.1P1. All messages of significance are reported to the appropriate log file. The scripts utilized in the production environment will indicate general success or failure of a specific run, but that is all.

2.5.3 Log and Status Files Results

The Log files contain all error and/or status messages produced by the PGE. The files are located in directory: **$CERESHOME/clouds/data/runlogs**.

2.5.3.1 Report Log File: CER4.1-4.1P1_LogReport_$SS4_4_$PS4_1_$CC4_1P1.YYYYMMDDHH

The log report file contains informational messages for the PGE. They indicate progression through critical steps of the code or use of contingency code that will handle data problems. They point to algorithms that were executing when program problems occur. A comprehensive list of these messages, that can be generated during the execution of the PGE, is contained in Appendix B.

2.5.3.2 Status Log File: CER4.1-4.1P1_LogStatus_$SS4_4_$PS4_1_$CC4_1P1.YYYYMMDDHH

The Status Log File contains all messages created by the Toolkit and fatal processing messages. If an abnormal exit is encountered by the PGE, this file should be examined for '_F_', fatal message type. The responsible person should be advised.

2.5.3.3 User Log File: CER4.1-4.1P1_LogUser_$SS4_4_$PS4_1_$CC4_1P1.YYYYMMDDHH

The User Log File is not used at this time, but exists to satisfy the Toolkit requirements. Typically the _U_ and _N_ (User information and Notice) will be written to User Log File and Status Log File.

2.5.3.4 ShmMem File: CER4.1-4.1P1_ShmMem

The ShmMem File exists to satisfy the Toolkit requirements and is not actively used by CER4.1-4.1P1.

2.5.4 Solutions to Possible Problems

The most likely problems encountered are missing input or ancillary data files, or existing output files. These should be identified in the Status Log File. These errors could also be linked to missing .met files or other problems related to a temporary file needed to process metadata. As mentioned in Section 2.4.4, all output files are opened with Status = NEW in Subsystem 4.1 software. Prior to any reprocessing, please run the Cleanup script.

2.6 Expected Output Dataset(s)

The expected Output Datasets are listed below for each instance of the PGE. This PGE is to be processed once per data-hour, for a maximum total of 744 hours per month per satellite. For satellites with multiple instruments, expect multiple outputs for the following datasets: CER_FQC, CER_FQCI, and CER_SSFI.

IMAG - Imager Short Name (MODIS)
INST - CERES Instrument Short Name (FM1, FM2)
PRODUCTION - Set to "YES" when run on a production computer
PS1 - Production Strategy for IES, see Production Request
PS4_0 - Production Strategy for Snow and Ice Map, see Production Request
PS4_1 - Production Strategy for CER4.1-4.1P2, see Production Request
PS4_2 - Production Strategy for Clear Sky Map, see Production Request
PS12 - Production Strategy for MOA, see Production Request
SAT - Satellite Short Name (Terra)
SS1 - Sampling Strategy for IES, see Production Request
SS4_0 - Sampling Strategy for Snow and Ice Map, see Production Request
SS4_1 - Sampling Strategy for CER4.1-4.1P2, see Production Request
SS4_2 - Sampling Strategy for Clear Sky Map, see Production Request
SS4_4 - Sampling Strategy for CER4.1-4.1P2, see Production Request

SS12 - Sampling Strategy for MOA, see Production Request
SW4_1 - Software SSCR # for Clouds, see CM Database

NOTE: In sequential processing, CC4_2, PS4_2, and SS4_2 would be the same as CC4_1P2, PS4_1, and SS4_1 respectively. On the first data day following a configuration code change, CC4_2 would have the configuration code used on the previous day. The other variables would not change.

NOTE: If hourly CloudVis processing is required, then set variable to y (yes) otherwise set to n (no). CloudVis Subset processing will not be affected by changes to CV variable.

During nonsequential processing, CC4_2, PS4_2, and SS4_2 will contain the values for the best Clear Sky Map available. This information may be supplied through the Production Request or obtained from the responsible person in Table 1-1. These would be different from CC4_1P2, PS4_1, and SS4_1.

Refer to the CERES internal paper (Reference 1) for a detailed description of the CERES environment parameters.

Also see Appendix D of this document for a detailed description of the Subsystem specific environment.

3.2.3 Execution Frequency

Hourly (1/hr/sat) - This PGE is to be processed once per data-hour, for a maximum total of 744 hours per month per satellite.

3.2.4 Memory/Disk Space/Time Requirements

Table 3-4. Memory/Disk Space/Time Requirements for CER4.1-4.1P2

PGE Number	PGE Name	Platform	Total Run Time (HR:MN:SEC)	Memory (MB)	Disk Storage (MB)

		Subset Terra	0:20:00	454	90

3.2.5 Restrictions Imposed in Processing Order

Please process each given day in sequential order. For individual hours within a given day order is unimportant. That is, process all hours from January 1, 1998 before processing January 2, 1998. This allows for updating the Clear Reflectance History (CRH) (CER4.1-4.2P2) for a given day which is input into the next day's PGEs.

3.4 Operating Procedures

The PGE CER4.1-4.1P2 production script, **Run.CER4.1-4.1P2**, references a Process Control File (PCF) which contains the correct file names and paths for the PGE. This PCF can be created by first sourcing the cloud retrieval-specific environment script, **CER4.1-4.env** then executing the PCF generator **CER4.1-4.1P2.PCFGen**.

3.4.1 How to Generate the PCF File

The environment script requires two optional command-line arguments: 1-digit satellite (X) and character string prefix to production strategy (N). The default satellite is TRMM, 1-NOAA09, 2-TRMM, and 3-Terra. The prefix is usually Subset that generates special processing where only data in CERES validation regions is used. The PCF generator, **CER_4.1-4.1P2.PCFGen**, requires six command-line arguments: 4-digit year (YYYY), 2-digit month (MM), 2-digit day (DD), and 2-digit hour-of-day (HH), 1-digit MODIS radiance and geolocation version number (VRG), and 1-digit MODIS aerosol version number (VA).

At the command-line (>) type:

> source $CERESHOME/clouds/bin/CER4.1-4.env X N
> $CERESHOME/clouds/bin/CER4.1-4.1P2.PCFGen YYYY MM DD HH VRG VA

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.1P2_PCFin_$SS4_4_$PS4_1_$CC4_1P2.YYYYMMDDHH and
CER4.1-4.1P2_PCF_$SS4_4_$PS4_1_$CC4_1P2.YYYYMMDDHH

3.4.2 How to Execute the Main Processor

Execute the production script by typing the script name, **Run.CER4.1-4.1P2**, followed by the PCF file name including directory.

At the command-line (>) type:

>cd $CERESHOME/clouds/bin
>$CERESHOME/clouds/bin/Run.CER4.1-4.1P2 $CERESHOME/clouds/rcf/
CER4.1-4.1P2_PCF_$SS4_4_$PS4_1_$CC4_1P2.YYYYMMDDHH

3.4.3 Special Case Considerations

There is a need to process imager data even when CERES data (IES) is not available. The production request will indicate that CERES instrument be set to NONE. The SSFI, FQC, and FQCI files will not be produced for these cases. The exit code will be 202, because convolution would not have processed successfully.

There are two CERES instruments on the Terra spacecraft, but only one imager. To efficiently process the data, two IES are input to convolution producing two SSFI files. This type of operation is indicated by a instrument environmental variable that includes both CERES instrument names separated by a "+". Each SSFI file name will only contain data from one instrument.

If the MODIS radiance and geolocation and MODIS aerosol version is not provided it will default to Version 004. The default cannot be used with the option described below.

There is an option while creating the PCF to only include up to four 5-minute MODIS granules in the PCF. This was designed to assist in over ARM processing so that MODIS files that are not needed can remain in the directory. The new format of how to generate the PCF is:
At the command-line (>) type:

> source $CERESHOME/clouds/bin/CER4.1-4.env X N
> $CERESHOME/clouds/bin/CER4.1-4.1P2.PCFGen YYYY MM DD HH VRG VA MM1 MM2 MM3 MM4

Where MM1, MM2, MM3, and MM4 are minute values of the MODIS granules. All are optional.

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.1P2_PCFin_$SS4_4_$PS4_1_$CC4_1P2.YYYYMMDDHH and
CER4.1-4.1P2_PCF_$SS4_4_$PS4_1_$CC4_1P2.YYYYMMDDHH

Other special case considerations will be handled on a case-by-case basis, where special instructions will accompany each special request.

3.4.4 Special Reprocessing Instructions

All output files are opened with Status = NEW in Subsystem 4.1 through 4.4 software. The output from previous runs must be removed before reprocessing. A cleanup script has been provided as a convenience. It is to be run prior to reprocessing.
At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>**$CERESHOME/clouds/bin/Run.CER4.1-4.Cleanup $CERESHOME/clouds/rcf/**
CER4.1-4.1P2_PCF_$SS4_4_$PS4_1_$CC4_1P2.YYYYMMDD

The cleanup script uses the PCFile from the PCFile Generator to identify files to be removed.

3.5 Execution Evaluation

3.5.1 Exit Codes

The processor CER4.1-4.1P2 terminates using the CERES-defined EXIT CODES for the Langley TRMM Information System (LaTIS) as seen in Table 3-5. Other Exit Codes may appear from the program, which may be the result of a system, compiler, or Toolkit related error. In these cases, contact the responsible person (see Table 1-1) for assistance.

Table 3-5. Exit Codes for CER4.1-4.1P2 (1 of 2)

Exit Code	Definition	Action
0	Normal Exit	Proceed Normally
99	Failure	Check Imager input files for compression or corruption.
137	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B).

Table 3-5. Exit Codes for CER4.1-4.1P2 (2 of 2)

Exit Code	Definition	Action
200	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). Check to ensure IES was staged and imager file was produced. This includes the case when no matching imager data was available for CERES footprints.
201	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). IES was not staged for convolution.
202	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). Usually indicates a foreseeable input error.
203	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B).

3.5.2 Screen Messages

Screen Messages are not normally encountered when running the production script Run.CER4.1-4.1P2. All messages of significance are reported to the appropriate log file. The scripts utilized in the production environment will indicate general success or failure of a specific run, but that is all.

3.5.3 Log and Status Files Results

The Log files contain all error and/or status messages produced by the PGE. The files are located in directory: **$CERESHOME/clouds/data/runlogs**.

3.5.3.1 Report Log File: CER4.1-4.1P2_LogReport_$SS4_4_$PS4_1_$CC4_1P2.YYYYMMDDHH

The log report file contains informational messages for the PGE. They indicate progression through critical steps of the code or use of contingency code that will handle data problems. They point to algorithms that were executing when program problems occur. A comprehensive list of these messages, that can be generated during the execution of the PGE, is contained in Appendix B.

3.5.3.2 Status Log File: CER4.1-4.1P2_LogStatus_$SS4_4_$PS4_1_$CC4_1P2.YYYYMMDDHH

The Status Log File contains all messages created by the Toolkit and fatal processing messages. If an abnormal exit is encountered by the PGE, this file should be examined for '_F_', fatal message type. The responsible person should be advised.

3.5.3.3 User Log File: CER4.1-4.1P2_LogUser_$SS4_4_$PS4_1_$CC4_1P2.YYYYMMDDHH

The User Log File is not used at this time, but exists to satisfy the Toolkit requirements. Typically the _U_ and _N_ (User information and Notice) will be written to User Log File and Status Log File.

3.5.3.4 ShmMem File: CER4.1-4.1P2_ShmMem

The ShmMem File exists to satisfy the Toolkit requirements and is not actively used by CER4.1-4.1P2.

3.5.4 Solutions to Possible Problems

The most likely problems encountered are missing input or ancillary data files, or existing output files. These should be identified in the Status Log File. These errors could also be linked to missing .met files or other problems related to a temporary file needed to process metadata. As mentioned in Section 3.4.4, all output files are opened with Status = NEW in Subsystem 4.1 software. Prior to any reprocessing, please run the Cleanup script.

3.6 Expected Output Dataset(s)

The expected Output Datasets are listed below for each instance of the PGE. This PGE is to be processed once per data-hour, for a maximum total of 744 hours per month per satellite. For satellites with multiple instruments, expect multiple outputs for the following datasets: CER_FQC, CER_FQCI, and CER_SSFI.

During nonsequential processing, CC4_2, PS4_2, and SS4_2 will contain the values for the best Clear Sky Map available. This information may be supplied through the Production Request or obtained from the responsible person in Table 1-1. These would be different from CC4_1P3, PS4_1, and SS4_1.

Refer to the CERES internal paper (Reference 1) for a detailed description of the CERES environment parameters.

Also see Appendix D of this document for a detailed description of the Subsystem specific environment.

4.2.3 Execution Frequency

4.2.4 Memory/Disk Space/Time Requirements

Table 4-4. Memory/Disk Space/Time Requirements for CER4.1-4.1P3

4.2.5 Restrictions Imposed in Processing Order

Please process each given day in sequential order. For individual hours within a given day order is unimportant. That is, process all hours from January 1, 1998 before processing January 2, 1998. This allows for updating the Clear Reflectance History (CRH) (CER4.1-4.2P3) for a given day which is input into the next day's PGEs.

f. Special Requirements: CERES FM4 experienced a shortwave detector anomaly on March 30, 2005. All FM4 IES created after that date has a different production strategy then the FM3 IES. The script will automatically handle it for Edition2 processing.

4.4 Operating Procedures

The PGE CER4.1-4.1P3 production script, **Run.CER4.1-4.1P3**, references a Process Control File (PCF) which contains the correct file names and paths for the PGE. This PCF can be created by first sourcing the cloud retrieval-specific environment script, **CER4.1-4.env** then executing the PCF generator **CER4.1-4.1P3.PCFGen**.

4.4.1 How to Generate the PCF File

The environment script requires two optional command-line arguments: 1-digit satellite (X) and character string prefix to production strategy (N). The default satellite is TRMM, 1-NOAA09, 2-TRMM, 3-Terra, and 6-Aqua. The prefix is usually Subset that generates special processing where only data in CERES validation regions is used. The PCF generator, **CER_4.1-4.1P3.PCFGen**, requires six command-line arguments: 4-digit year (YYYY), 2-digit month (MM), 2-digit day (DD), and 2-digit hour-of-day (HH), 1-digit MODIS radiance and geolocation version number (VRG), and 1-digit MODIS aerosol version number (VA).

At the command-line (>) type:

> source $CERESHOME/clouds/bin/CER4.1-4.env X N
> **$CERESHOME/clouds/bin/CER4.1-4.1P3.PCFGen YYYY MM DD HH VRG VA**

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.1P3_PCFin_$SS4_4_$PS4_1_$CC4_1P3.YYYYMMDDHH and
CER4.1-4.1P3_PCF_$SS4_4_$PS4_1_$CC4_1P3.YYYYMMDDHH

4.4.2 How to Execute the Main Processor

Execute the production script by typing the script name, **Run.CER4.1-4.1P3**, followed by the PCF file name including directory.

At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>$CERESHOME/clouds/bin/Run.CER4.1-4.1P3 $CERESHOME/clouds/rcf/
CER4.1-4.1P3_PCF_$SS4_4_$PS4_1_$CC4_1P3.YYYYMMDDHH

4.4.3 Special Case Considerations

There is a need to process imager data even when CERES data (IES) is not available. The production request will indicate that CERES instrument be set to NONE. The SSFI, FQC, and FQCI files will not be produced for these cases. The exit code will be 202, because convolution would not have processed successfully.

There are two CERES instruments on the Terra spacecraft, but only one imager. To efficiently process the data, two IES are input to convolution producing two SSFI files. This type of operation is indicated by a instrument environmental variable that includes both CERES instrument names separated by a "+". Each SSFI file name will only contain data from one instrument.

There is an option while creating the PCF to only include up to four 5-minute MODIS granules in the PCF. This was designed to assist in over ARM processing so that MODIS files that are not needed can remain in the directory. The new format of how to generate the PCF is:
At the command-line (>) type:

> **> source $CERESHOME/clouds/bin/CER4.1-4.env X N**
> **> $CERESHOME/clouds/bin/CER4.1-4.1P3.PCFGen YYYY MM DD HH VRG VA MM1 MM2 MM3 MM4**

Where MM1, MM2, MM3, and MM4 are minute values of the MODIS granules. All are optional.

The following files will be generated in **$CERESHOME/clouds/rcf/**:

> **CER4.1-4.1P3_PCFin_$SS4_4_$PS4_1_$CC4_1P3.YYYYMMDDHH and CER4.1-4.1P3_PCF_$SS4_4_$PS4_1_$CC4_1P3.YYYYMMDDHH**

Other special case considerations will be handled on a case-by-case basis, where special instructions will accompany each special request.

4.4.4 Special Reprocessing Instructions

All output files are opened with Status = NEW in Subsystem 4.1 through 4.4 software. The output from previous runs must be removed before reprocessing. A cleanup script has been provided as a convenience. It is to be run prior to reprocessing.

At the command-line (>) type:

> **>cd $CERESHOME/clouds/bin**
> **>$CERESHOME/clouds/bin/Run.CER4.1-4.Cleanup $CERESHOME/clouds/rcf/ CER4.1-4.1P3_PCF_$SS4_4_$PS4_1_$CC4_1P3.YYYYMMDD**

The cleanup script uses the PCFile from the PCFile Generator to identify files to be removed.

4.5 Execution Evaluation

4.5.1 Exit Codes

The processor CER4.1-4.1P3 terminates using the CERES-defined EXIT CODES for the Langley TRMM Information System (LaTIS) as seen in Table 4-5. Other Exit Codes may appear from the program, which may be the result of a system, compiler, or Toolkit related error. In these cases, contact the responsible person (see Table 1-1) for assistance.

Table 4-5. Exit Codes for CER4.1-4.1P3

Exit Code	Definition	Action
0	Normal Exit	Proceed Normally
99	Failure	Check Imager input files for compression or corruption.
137	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B).
200	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). Check to ensure IES was staged and imager file was produced. This includes the case when no matching imager data was available for CERES footprints.
201	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). IES was not staged for convolution.
202	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). Usually indicates a foreseeable input error.
203	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B).

4.5.2 Screen Messages

Screen Messages are not normally encountered when running the production script Run.CER4.1-4.1P3. All messages of significance are reported to the appropriate log file. The scripts utilized in the production environment will indicate general success or failure of a specific run, but that is all.

4.5.3 Log and Status Files Results

The Log files contain all error and/or status messages produced by the PGE. The files are located in directory: **$CERESHOME/clouds/data/runlogs**.

4.5.3.1 Report Log File: CER4.1-4.1P3_LogReport_$SS4_4_$PS4_1_$CC4_1P3.YYYYMMDDHH

The log report file contains informational messages for the PGE. They indicate progression through critical steps of the code or use of contingency code that will handle data problems. They point to algorithms that were executing when program problems occur. A comprehensive list of these messages, that can be generated during the execution of the PGE, is contained in Appendix B.

4.5.3.2 Status Log File: CER4.1-4.1P3_LogStatus_$SS4_4_$PS4_1_$CC4_1P3.YYYYMMDDHH

The Status Log File contains all messages created by the Toolkit and fatal processing messages. If an abnormal exit is encountered by the PGE, this file should be examined for '_F_', fatal message type. The responsible person should be advised.

4.5.3.3 User Log File: CER4.1-4.1P3_LogUser_$SS4_4_$PS4_1_$CC4_1P3.YYYYMMDDHH

The User Log File is not used at this time, but exists to satisfy the Toolkit requirements. Typically the _U_ and _N_ (User information and Notice) will be written to User Log File and Status Log File.

4.5.3.4 ShmMem File: CER4.1-4.1P3_ShmMem

The ShmMem File exists to satisfy the Toolkit requirements and is not actively used by CER4.1-4.1P3.

4.5.4 Solutions to Possible Problems

The most likely problems encountered are missing input or ancillary data files, or existing output files. These should be identified in the Status Log File. These errors could also be linked to missing .met files or other problems related to a temporary file needed to process metadata. As mentioned in Section 4.4.4, all output files are opened with Status = NEW in Subsystem 4.1 software. Prior to any reprocessing, please run the Cleanup script.

4.6 Expected Output Dataset(s)

The expected Output Datasets are listed below for each instance of the PGE. This PGE is to be processed once per data-hour, for a maximum total of 744 hours per month per satellite. For satellites with multiple instruments, expect multiple outputs for the following datasets:

CER_FQC, CER_FQCI, and CER_SSFI.

During nonsequential processing, CC4_2, PS4_2, and SS4_2 will contain the values for the best Clear Sky Map available. This information may be supplied through the Production Request or obtained from the responsible person in Table 1-1. These would be different from CC4_1P4, PS4_1, and SS4_1.

Refer to the CERES internal paper (Reference 1) for a detailed description of the CERES environment parameters.

Also see Appendix D of this document for a detailed description of the Subsystem specific environment.

5.2.3 Execution Frequency

Hourly (1/hr/sat) - This PGE is to be processed once per data-hour, for a maximum total of 744 hours per month per satellite.

5.2.4 Memory/Disk Space/Time Requirements

Table 5-4. Memory/Disk Space/Time Requirements for CER4.1-4.1P4

5.2.5 Restrictions Imposed in Processing Order

Please process each given day in sequential order. For individual hours within a given day order is unimportant. That is, process all hours from January 1, 1998 before processing January 2, 1998. This allows for updating the Clear Reflectance History (CRH) (CER4.1-4.2P2) for a given day which is input into the next day's PGEs.

5.4 Operating Procedures

The PGE CER4.1-4.1P4 production script, **Run.CER4.1-4.1P4**, references a Process Control File (PCF) which contains the correct file names and paths for the PGE. This PCF can be created by first sourcing the cloud retrieval-specific environment script, **CER4.1-4.env** then executing the PCF generator **CER4.1-4.1P4.PCFGen**.

5.4.1 How to Generate the PCF File

The environment script requires two optional command-line arguments: 1-digit satellite (X) and character string prefix to production strategy (N). The default satellite is TRMM, 1-NOAA09, 2-TRMM, and 3-Terra. The prefix is usually Subset that generates special processing where only data in CERES validation regions is used. The PCF generator, **CER_4.1-4.1P4.PCFGen**, requires six command-line arguments: 4-digit year (YYYY), 2-digit month (MM), 2-digit day (DD), and 2-digit hour-of-day (HH), 1-digit MODIS radiance and geolocation version number (VRG), and 1-digit MODIS aerosol version number (VA).

At the command-line (>) type:

> source $CERESHOME/clouds/bin/CER4.1-4.env X N
> $CERESHOME/clouds/bin/CER4.1-4.1P4.PCFGen YYYY MM DD HH VRG VA

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.1P4_PCFin_$SS4_4_$PS4_1_$CC4_1P4.YYYYMMDDHH and
CER4.1-4.1P4_PCF_$SS4_4_$PS4_1_$CC4_1P4.YYYYMMDDHH

5.4.2 How to Execute the Main Processor

Execute the production script by typing the script name, **Run.CER4.1-4.1P4**, followed by the PCF file name including directory.

At the command-line (>) type:

>cd $CERESHOME/clouds/bin
>$CERESHOME/clouds/bin/Run.CER4.1-4.1P4 $CERESHOME/clouds/rcf/
CER4.1-4.1P4_PCF_$SS4_4_$PS4_1_$CC4_1P4.YYYYMMDDHH

5.4.3 Special Case Considerations

There is a need to process imager data even when CERES data (IES) is not available. The production request will indicate that CERES instrument be set to NONE. The SSFI, FQC, and FQCI files will not be produced for these cases. The exit code will be 202, because convolution would not have processed successfully.

There are two CERES instruments on the Terra spacecraft, but only one imager. To efficiently process the data, two IES are input to convolution producing two SSFI files. This type of operation is indicated by a instrument environmental variable that includes both CERES instrument names separated by a "+". Each SSFI file name will only contain data from one instrument.

If the MODIS radiance and geolocation and MODIS aerosol version is not provided it will default to Version 005. The default cannot be used with the option described below.

There is an option while creating the PCF to only include up to four 5-minute MODIS granules in the PCF. This was designed to assist in over ARM processing so that MODIS files that are not needed can remain in the directory. The new format of how to generate the PCF is:
At the command-line (>) type:

> source $CERESHOME/clouds/bin/CER4.1-4.env X N
> $CERESHOME/clouds/bin/CER4.1-4.1P4.PCFGen YYYY MM DD HH VRG VA MM1 MM2 MM3 MM4

Where MM1, MM2, MM3, and MM4 are minute values of the MODIS granules. All are optional.

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.1P4_PCFin_$SS4_4_$PS4_1_$CC4_1P4.YYYYMMDDHH and
CER4.1-4.1P4_PCF_$SS4_4_$PS4_1_$CC4_1P4.YYYYMMDDHH

Other special case considerations will be handled on a case-by-case basis, where special instructions will accompany each special request.

5.4.4 Special Reprocessing Instructions

All output files are opened with Status = NEW in Subsystem 4.1 through 4.4 software. The output from previous runs must be removed before reprocessing. A cleanup script has been provided as a convenience. It is to be run prior to reprocessing.
At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>**$CERESHOME/clouds/bin/Run.CER4.1-4.Cleanup $CERESHOME/clouds/rcf/**
CER4.1-4.1P4_PCF_$SS4_4_$PS4_1_$CC4_1P4.YYYYMMDD

The cleanup script uses the PCFile from the PCFile Generator to identify files to be removed.

5.5 Execution Evaluation

5.5.1 Exit Codes

The processor CER4.1-4.1P4 terminates using the CERES-defined EXIT CODES for the Langley TRMM Information System (LaTIS) as seen in Table 5-5. Other Exit Codes may appear from the program, which may be the result of a system, compiler, or Toolkit related error. In these cases, contact the responsible person (see Table 1-1) for assistance.

Table 5-5. Exit Codes for CER4.1-4.1P4 (1 of 2)

Exit Code	Definition	Action
0	Normal Exit	Proceed Normally
99	Failure	Check Imager input files for compression or corruption.
137	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B).

Table 5-5. Exit Codes for CER4.1-4.1P4 (2 of 2)

Exit Code	Definition	Action
200	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). Check to ensure IES was staged and imager file was produced. This includes the case when no matching imager data was available for CERES footprints.
201	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). IES was not staged for convolution.
202	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). Usually indicates a foreseeable input error.
203	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B).

5.5.2 Screen Messages

Screen Messages are not normally encountered when running the production script Run.CER4.1-4.1P4. All messages of significance are reported to the appropriate log file. The scripts utilized in the production environment will indicate general success or failure of a specific run, but that is all.

5.5.3 Log and Status Files Results

The Log files contain all error and/or status messages produced by the PGE. The files are located in directory: **$CERESHOME/clouds/data/runlogs**.

5.5.3.1 Report Log File: CER4.1-4.1P4_LogReport_$SS4_4_$PS4_1_$CC4_1P4.YYYYMMDDHH

The log report file contains informational messages for the PGE. They indicate progression through critical steps of the code or use of contingency code that will handle data problems. They point to algorithms that were executing when program problems occur. A comprehensive list of these messages, that can be generated during the execution of the PGE, is contained in Appendix B.

5.5.3.2 Status Log File: CER4.1-4.1P4_LogStatus_$SS4_4_$PS4_1_$CC4_1P4.YYYYMMDDHH

The Status Log File contains all messages created by the Toolkit and fatal processing messages. If an abnormal exit is encountered by the PGE, this file should be examined for '_F_', fatal message type. The responsible person should be advised.

5.5.3.3 User Log File: CER4.1-4.1P4_LogUser_$SS4_4_$PS4_1_$CC4_1P4.YYYYMMDDHH

The User Log File is not used at this time, but exists to satisfy the Toolkit requirements. Typically the _U_ and _N_ (User information and Notice) will be written to User Log File and Status Log File.

5.5.3.4 ShmMem File: CER4.1-4.1P4_ShmMem

The ShmMem File exists to satisfy the Toolkit requirements and is not actively used by CER4.1-4.1P4.

5.5.4 Solutions to Possible Problems

The most likely problems encountered are missing input or ancillary data files, or existing output files. These should be identified in the Status Log File. These errors could also be linked to missing .met files or other problems related to a temporary file needed to process metadata. As mentioned in Section 5.4.4, all output files are opened with Status = NEW in Subsystem 4.1 software. Prior to any reprocessing, please run the Cleanup script.

5.6 Expected Output Dataset(s)

The expected Output Datasets are listed below for each instance of the PGE. This PGE is to be processed once per data-hour, for a maximum total of 744 hours per month per satellite. For satellites with multiple instruments, expect multiple outputs for the following datasets: CER_FQC, CER_FQCI, and CER_SSFI.

SS12 - Sampling Strategy for MOA, see Production Request

NOTE: In sequential processing, CC4_2, PS4_2, and SS4_2 would be the same as CC4_1P5, PS4_1, and SS4_1 respectively. On the first data day following a configuration code change, CC4_2 would have the configuration code used on the previous day. The other variables would not change.

NOTE: If hourly CloudVis processing is required, then set variable to y (yes) otherwise set to n (no). CloudVis Subset processing will not be affected by changes to CV variable.

During nonsequential processing, CC4_2, PS4_2, and SS4_2 will contain the values for the best Clear Sky Map available. This information may be supplied through the Production Request or obtained from the responsible person in Table 1-1. These would be different from CC4_1P5, PS4_1, and SS4_1.

Refer to the CERES internal paper (Reference 1) for a detailed description of the CERES environment parameters.

Also see Appendix D of this document for a detailed description of the Subsystem specific environment.

6.2.3 Execution Frequency

Hourly (1/hr/sat) - This PGE is to be processed once per data-hour, for a maximum total of 744 hours per month per satellite.

6.2.4 Memory/Disk Space/Time Requirements

Table 6-4. Memory/Disk Space/Time Requirements for CER4.1-4.1P5

PGE Number	PGE Name	Platform	Total Run Time (HR:MN:SEC)	Memory (MB)	Disk Storage (MB)
CER4.1-4.1P5	Cloud Property Retrieval and Convolution	Aqua	3:00:00	465	425
		Subset Aqua	0:20:00	454	90

6.2.5 Restrictions Imposed in Processing Order

Please process each given day in sequential order. For individual hours within a given day order is unimportant. That is, process all hours from January 1, 1998 before processing January 2, 1998. This allows for updating the Clear Reflectance History (CRH) (CER4.1-4.2P5) for a given day which is input into the next day's PGEs.

f. Special Requirements: CERES FM4 experienced a shortwave detector anomaly on March 30, 2005. All FM4 IES created after that date has a different production strategy then the FM3 IES. The script will automatically handle it for Edition2 processing.

6.4 Operating Procedures

The PGE CER4.1-4.1P5 production script, **Run.CER4.1-4.1P5**, references a Process Control File (PCF) which contains the correct file names and paths for the PGE. This PCF can be created by first sourcing the cloud retrieval-specific environment script, **CER4.1-4.env** then executing the PCF generator **CER4.1-4.1P5.PCFGen**.

6.4.1 How to Generate the PCF File

The environment script requires two optional command-line arguments: 1-digit satellite (X) and character string prefix to production strategy (N). The default satellite is TRMM, 1-NOAA09, 2-TRMM, 3-Terra, and 6-Aqua. The prefix is usually Subset that generates special processing where only data in CERES validation regions is used. The PCF generator, **CER_4.1-4.1P5.PCFGen**, requires six command-line arguments: 4-digit year (YYYY), 2-digit month (MM), 2-digit day (DD), and 2-digit hour-of-day (HH), 1-digit MODIS radiance and geolocation version number (VRG), and 1-digit MODIS aerosol version number (VA).

At the command-line (>) type:

> source $CERESHOME/clouds/bin/CER4.1-4.env X N
> **$CERESHOME/clouds/bin/CER4.1-4.1P5.PCFGen YYYY MM DD HH VRG VA**

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.1P5_PCFin_$SS4_4_$PS4_1_$CC4_1P5.YYYYMMDDHH and
CER4.1-4.1P5_PCF_$SS4_4_$PS4_1_$CC4_1P5.YYYYMMDDHH

6.4.2 How to Execute the Main Processor

Execute the production script by typing the script name, **Run.CER4.1-4.1P5**, followed by the PCF file name including directory.

At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>$CERESHOME/clouds/bin/Run.CER4.1-4.1P5 $CERESHOME/clouds/rcf/
CER4.1-4.1P5_PCF_$SS4_4_$PS4_1_$CC4_1P5.YYYYMMDDHH

6.4.3 Special Case Considerations

There is a need to process imager data even when CERES data (IES) is not available. The production request will indicate that CERES instrument be set to NONE. The SSFI, FQC, and FQCI files will not be produced for these cases. The exit code will be 202, because convolution would not have processed successfully.

There are two CERES instruments on the Terra spacecraft, but only one imager. To efficiently process the data, two IES are input to convolution producing two SSFI files. This type of operation is indicated by a instrument environmental variable that includes both CERES instrument names separated by a "+". Each SSFI file name will only contain data from one instrument.

There is an option while creating the PCF to only include up to four 5-minute MODIS granules in the PCF. This was designed to assist in over ARM processing so that MODIS files that are not needed can remain in the directory. The new format of how to generate the PCF is:
At the command-line (>) type:

> source $CERESHOME/clouds/bin/CER4.1-4.env X N
> **$CERESHOME/clouds/bin/CER4.1-4.1P5.PCFGen YYYY MM DD HH VRG VA MM1 MM2 MM3 MM4**

Where MM1, MM2, MM3, and MM4 are minute values of the MODIS granules. All are optional.

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.1P5_PCFin_$SS4_4_$PS4_1_$CC4_1P5.YYYYMMDDHH and
CER4.1-4.1P5_PCF_$SS4_4_$PS4_1_$CC4_1P5.YYYYMMDDHH

Other special case considerations will be handled on a case-by-case basis, where special instructions will accompany each special request.

6.4.4 Special Reprocessing Instructions

All output files are opened with Status = NEW in Subsystem 4.1 through 4.4 software. The output from previous runs must be removed before reprocessing. A cleanup script has been provided as a convenience. It is to be run prior to reprocessing.

At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>$CERESHOME/clouds/bin/Run.CER4.1-4.Cleanup $CERESHOME/clouds/rcf/
CER4.1-4.1P5_PCF_$SS4_4_$PS4_1_$CC4_1P5.YYYYMMDD

The cleanup script uses the PCFile from the PCFile Generator to identify files to be removed.

6.5 Execution Evaluation

6.5.1 Exit Codes

The processor CER4.1-4.1P5 terminates using the CERES-defined EXIT CODES for the Langley TRMM Information System (LaTIS) as seen in Table 6-5. Other Exit Codes may appear from the program, which may be the result of a system, compiler, or Toolkit related error. In these cases, contact the responsible person (see Table 1-1) for assistance.

Table 6-5. Exit Codes for CER4.1-4.1P5

Exit Code	Definition	Action
0	Normal Exit	Proceed Normally
99	Failure	Check Imager input files for compression or corruption.
137	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B).
200	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). Check to ensure IES was staged and imager file was produced. This includes the case when no matching imager data was available for CERES footprints.
201	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). IES was not staged for convolution.
202	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B). Usually indicates a foreseeable input error.
203	Failure	Check the Log Files and operations email and take the appropriate action (see Appendix B).

6.5.2 Screen Messages

Screen Messages are not normally encountered when running the production script Run.CER4.1-4.1P5. All messages of significance are reported to the appropriate log file. The scripts utilized in the production environment will indicate general success or failure of a specific run, but that is all.

6.5.3 Log and Status Files Results

The Log files contain all error and/or status messages produced by the PGE. The files are located in directory: **$CERESHOME/clouds/data/runlogs**.

6.5.3.1 Report Log File: CER4.1-4.1P5_LogReport_$SS4_4_$PS4_1_$CC4_1P5.YYYYMMDDHH

The log report file contains informational messages for the PGE. They indicate progression through critical steps of the code or use of contingency code that will handle data problems. They point to algorithms that were executing when program problems occur. A comprehensive list of these messages, that can be generated during the execution of the PGE, is contained in Appendix B.

6.5.3.2 Status Log File: CER4.1-4.1P5_LogStatus_$SS4_4_$PS4_1_$CC4_1P5.YYYYMMDDHH

The Status Log File contains all messages created by the Toolkit and fatal processing messages. If an abnormal exit is encountered by the PGE, this file should be examined for '_F_', fatal message type. The responsible person should be advised.

6.5.3.3 User Log File: CER4.1-4.1P5_LogUser_$SS4_4_$PS4_1_$CC4_1P5.YYYYMMDDHH

The User Log File is not used at this time, but exists to satisfy the Toolkit requirements. Typically the _U_ and _N_ (User information and Notice) will be written to User Log File and Status Log File.

6.5.3.4 ShmMem File: CER4.1-4.1P5_ShmMem

The ShmMem File exists to satisfy the Toolkit requirements and is not actively used by CER4.1-4.1P5.

6.5.4 Solutions to Possible Problems

The most likely problems encountered are missing input or ancillary data files, or existing output files. These should be identified in the Status Log File. These errors could also be linked to missing .met files or other problems related to a temporary file needed to process metadata. As mentioned in Section 6.4.4, all output files are opened with Status = NEW in Subsystem 4.1 software. Prior to any reprocessing, please run the Cleanup script.

6.6 Expected Output Dataset(s)

The expected Output Datasets are listed below for each instance of the PGE. This PGE is to be processed once per data-hour, for a maximum total of 744 hours per month per satellite. For satellites with multiple instruments, expect multiple outputs for the following datasets: CER_FQC, CER_FQCI, and CER_SSFI.

7.2.2 Environment Script Requirements

One environment script, named 'CER4.1-4.env', is required and contains the following parameters:

CC4_2P1 - Configuration Code for CER4.1-4.2P1, see CM Database
CC4_2 - Configuration Code for Clear Sky Map, see CM Database and Production Request
DATA4_1 - Data SCCR# for Clouds, see CM Database
IMAG - Imager Short Name (VIRS, MODIS)
INST - CERES Instrument Short Name as defined for the hourly PGE (PFM, SIM, FM1, FM2,

FM1+FM2, FM3, FM4, FM3+FM4)
PS4_1 - Production Strategy for CER4.1-4.2P1, see Production Request
PS4_2 - Production Strategy for Clear Sky Map, see Production Request
SAT - Satellite Short Name (TRMM, Terra)
SS4_1 - Sampling Strategy for CER4.1-4.2P1, see Production Request
SS4_2 - Sampling Strategy for Clear Sky Map, see Production Request
SW4_1 - Software SSCR # for Clouds, see CM Database

NOTE: In sequential processing, CC4_2, PS4_2, and SS4_2 would be the same as CC4_2P1, PS4_1, and SS4_1 respectively. On the first data day following a configuration code change, CC4_2 would have the configuration code used on the previous day. The other variables would not change.

During nonsequential processing, CC4_2, PS4_2, and SS4_2 will contain the values for the best Clear Sky Map available to use as an input. This information may be supplied through the Production Request or obtained from the responsible person in Table 1-1. These would be different from CC4_2P1, PS4_1, and SS4_1.

Refer to the CERES internal paper (Reference 1) for a detailed description of the CERES environment parameters.

Also see Appendix D of this document for a detailed description of the Subsystem specific environment.

7.4 Operating Procedures

The PGE CER4.1-4.2P1 production script, **Run.CER4.1-4.2P1**, references a Process Control File (PCF) which contains the correct file names and paths for the PGE. This PCF can be created by first sourcing the cloud retrieval-specific environment script, **CER4.1-4.env** then executing the PCF generator **CER4.1-4.2P1.PCFGen**.

7.4.1 How to Generate the PCF File

The environment script requires two optional command-line arguments: 1-digit satellite (X) and character string prefix to production strategy (N). The default satellite is TRMM, 1-NOAA09, 2-TRMM, 3-Terra, and 6-Aqua. The prefix is usually Subset that generates special processing where

only data in CERES validation regions is used. The PCF generator, **CER_4.1-4.2P1.PCFGen**, requires three command-line arguments: 4-digit year (YYYY), 2-digit month (MM), and 2-digit day (DD)

At the command-line (>) type:

> source $CERESHOME/clouds/bin/CER4.1-4.env X N
> $CERESHOME/clouds/bin/CER4.1-4.2P1.PCFGen YYYY MM DD

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.2P1_PCFin_$SS4_1_$PS4_1_$CC4_2P1.YYYYMMDD
CER4.1-4.2P1_PCF_$SS4_1_$PS4_1_$CC4_2P1.YYYYMMDD

7.4.2 How to Execute the Main Processor

Execute the production script by typing the script name, **Run.CER4.1-4.2P1**, followed by the PCF file name including directory.

At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>$CERESHOME/clouds/bin/Run.CER4.1-4.2P1 $CERESHOME/clouds/rcf/
CER4.1-4.2P1_PCF_$SS4_1_$PS4_1_$CC4_2P1.YYYYMMDD

7.4.3 Special Case Considerations

Special case considerations will be handled on a case-by-case basis, where special instructions will accompany each special request. When processing two days before Clear Sky Update, only the Daily QC files will be produced.

7.4.4 Special Reprocessing Instructions

All output files are opened with Status = NEW in Subsystem 4.1 through 4.4 software. The output from previous runs must be removed before reprocessing. A cleanup script has been provided as a convenience. It is to be run prior to reprocessing.

At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>$CERESHOME/clouds/bin/Run.CER4.1-4.Cleanup $CERESHOME/clouds/rcf/
CER4.1-4.2P1_PCF_$SS4_1_$PS4_1_$CC4_2P1.YYYYMMDD

The cleanup script uses the PCFile from the PCFile Generator to identify files to be removed.

7.5 Execution Evaluation

7.5.1 Exit Codes

The processor CER4.1-4.2P1 terminates using the CERES-defined EXIT CODES for the Langley TRMM Information System (LaTIS) as seen in Table 7-5. Other Exit Codes may appear from the program, which may be the result of a system, compiler, or Toolkit related error. In these cases, contact the responsible person (see Table 1-1) for assistance.

Table 7-5. Exit Codes for CER4.1-4.2P1

Exit Code	Definition	Action
0	Normal Exit	Proceed normally
Other	Failure	Call responsible persons

7.5.2 Screen Messages

When running the production script, Run.CER4.1-4.2P1, the system message, "No match," may be written to the screen. This message occurs when the scripts try to remove an old output file that does not exist. This does not signify a problem.

7.5.3 Log and Status Files Results

The Log files contain all error and/or status messages produced by the PGE. The files are located in directory: **$CERESHOME/clouds/data/runlogs**.

7.5.3.1 Report Log File: CER4.1-4.2P1_LogReport_$SS4_1_$PS4_1_$CC4_2P1.YYYYMMDD

The log report file contains informational messages for the PGE. They indicate progression through critical steps of the code or use of contingency code that will handle data problems. They point to algorithms that were executing when program problems occur. A comprehensive list of these messages, that can be generated during the execution of the PGE, is contained in Appendix B.

7.5.3.2 Status Log File: CER4.1-4.2P1_LogStatus_$SS4_1_$PS4_1_$CC4_2P1.YYYYMMDD

The Status Log File contains all messages created by the Toolkit and fatal processing messages. If an abnormal exit is encountered by the PGE, this file should be examined for '_F_', fatal message type. The responsible person should be advised.

7.5.3.3 User Log File: CER4.1-4.2P1_LogUser_$SS4_1_$PS4_1_$CC4_2P1.YYYYMMDD

The User Log File is not used at this time, but exists to satisfy the Toolkit requirements. Typically the _U_ and _N_ (User information and Notice) will be written to User Log File and Status Log File.

7.5.3.4 ShmMem File: CER4.1-4.2P1_ShmMem

The ShmMem File exists to satisfy the Toolkit requirements and is not actively used by CER4.1-4.2P1.

7.5.4 Solutions to Possible Problems

The most likely problems encountered are missing input or ancillary data files, or existing output files. These should be identified in the Status Log File. These errors could also be linked to missing .met files or other problems related to a temporary file needed to process metadata. As mentioned in Section 7.4.4, all output files are opened with Status = NEW in Subsystem 4.1 software. Prior to any reprocessing, please run the Cleanup script.

7.5.5 Conditions for Subsystem and/or Target PGE(s) Terminal Failure (Halt all further processing)

a. Subsystem Termination

There are no foreseeable Subsystem terminating conditions at this time. If one day fails, continue processing the next day.

b. Target PGE Termination

There are no foreseeable Subsystem terminating conditions at this time. If the day fails, continue processing.

7.6 Expected Output Datasets

The expected Output Datasets are listed below for each instance of the PGE. This PGE is expected to process 31 times, maximum, in a 31 day month per satellite.

IMAG - Imager Short Name (MODIS)
PS4_1 - Production Strategy for CER4.1-4.2P2, see Production Request
PS4_2 - Production Strategy for Clear Sky Map, see Production Request
SAT - Satellite Short Name (Terra)
SS4_1 - Sampling Strategy for CER4.1-4.2P2, see Production Request
SS4_2 - Sampling Strategy for Clear Sky Map, see Production Request
SW4_1 - Software SSCR # for Clouds, see CM Database

NOTE: In sequential processing, CC4_2, PS4_2, and SS4_2 would be the same as CC4_2P2, PS4_1, and SS4_1 respectively. On the first data day following a configuration code change, CC4_2 would have the configuration code used on the previous day. The other variables would not change.

During nonsequential processing, CC4_2, PS4_2, and SS4_2 will contain the values for the best Clear Sky Map available to use as an input. This information may be supplied through the Production Request or obtained from the responsible person in Table 1-1. These would be different from CC4_2P2, PS4_1, and SS4_1.

Refer to the CERES internal paper (Reference 1) for a detailed description of the CERES environment parameters.

Also see Appendix D of this document for a detailed description of the Subsystem specific environment.

8.4 Operating Procedures

The PGE CER4.1-4.2P2 production script, **Run.CER4.1-4.2P2**, references a Process Control File (PCF) which contains the correct file names and paths for the PGE. This PCF can be created by first sourcing the cloud retrieval-specific environment script, **CER4.1-4.env** then executing the PCF generator **CER4.1-4.2P2.PCFGen**.

8.4.1 How to Generate the PCF File

The environment script requires two optional command-line arguments: 1-digit satellite (X) and character string prefix to production strategy (N). The default satellite is TRMM, 1-NOAA09, 2-TRMM, 3-Terra, and 6-Aqua. The prefix is usually Subset that generates special processing where only data in CERES validation regions is used. The PCF generator, **CER_4.1-4.2P2.PCFGen**, requires three command-line arguments: 4-digit year (YYYY), 2-digit month (MM), and 2-digit day (DD)

At the command-line (>) type:

> source $CERESHOME/clouds/bin/CER4.1-4.env X N
> $CERESHOME/clouds/bin/CER4.1-4.2P2.PCFGen YYYY MM DD

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.2P2_PCFin_$SS4_1_$PS4_1_$CC4_2P2.YYYYMMDD
CER4.1-4.2P2_PCF_$SS4_1_$PS4_1_$CC4_2P2.YYYYMMDD

8.4.2 How to Execute the Main Processor

Execute the production script by typing the script name, **Run.CER4.1-4.2P2**, followed by the PCF file name including directory.

At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>$CERESHOME/clouds/bin/Run.CER4.1-4.2P2 $CERESHOME/clouds/rcf/
CER4.1-4.2P2_PCF_$SS4_1_$PS4_1_$CC4_2P2.YYYYMMDD

8.4.3 Special Case Considerations

When processing requires running two days simultaneously, the optional runtime parameter for the prior day can be used. This will use both days of clear sky update files(CRHU) to build the new maps. It should not be run across data month boundaries in this manner. Format for the PCF file generator is:

>$CERESHOME/clouds/bin/CER4.1-4.2P2.PCFGen YYYY MM DD PYYY PM PD

8.4.4 Special Reprocessing Instructions

All output files are opened with Status = NEW in Subsystem 4.1 through 4.4 software. The output from previous runs must be removed before reprocessing. A cleanup script has been provided as a convenience. It is to be run prior to reprocessing.

At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>$CERESHOME/clouds/bin/Run.CER4.1-4.Cleanup $CERESHOME/clouds/rcf/
CER4.1-4.2P2_PCF_$SS4_1_$PS4_1_$CC4_2P2.YYYYMMDD

The cleanup script uses the PCFile from the PCFile Generator to identify files to be removed.

8.5 Execution Evaluation

8.5.1 Exit Codes

The processor CER4.1-4.2P2 terminates using the CERES-defined EXIT CODES for the Langley TRMM Information System (LaTIS) as seen in Table 8-5. Other Exit Codes may appear from the program, which may be the result of a system, compiler, or Toolkit related error. In these cases, contact the responsible person (see Table 1-1) for assistance.

Table 8-5. Exit Codes for CER4.1-4.2P2

Exit Code	Definition	Action
0	Normal Exit	Proceed normally
Other	Failure	Call responsible persons

8.5.2 Screen Messages

When running the production script, Run.CER4.1-4.2P2, the system message, "No match," may be written to the screen. This message occurs when the scripts try to remove an old output file that does not exist. This does not signify a problem.

8.5.3 Log and Status Files Results

The Log files contain all error and/or status messages produced by the PGE. The files are located in directory: **$CERESHOME/clouds/data/runlogs**.

8.5.3.1 Report Log File: CER4.1-4.2P2_LogReport_$SS4_1_$PS4_1_$CC4_2P2.YYYYMMDD

The log report file contains informational messages for the PGE. They indicate progression through critical steps of the code or use of contingency code that will handle data problems. They point to algorithms that were executing when program problems occur. A comprehensive list of these messages, that can be generated during the execution of the PGE, is contained in Appendix B.

8.5.3.2 Status Log File: CER4.1-4.2P2_LogStatus_$SS4_1_$PS4_1_$CC4_2P2.YYYYMMDD

The Status Log File contains all messages created by the Toolkit and fatal processing messages. If an abnormal exit is encountered by the PGE, this file should be examined for '_F_', fatal message type. The responsible person should be advised.

8.5.3.3 User Log File: CER4.1-4.2P2_LogUser_$SS4_1_$PS4_1_$CC4_2P2.YYYYMMDD

The User Log File is not used at this time, but exists to satisfy the Toolkit requirements. Typically the _U_ and _N_ (User information and Notice) will be written to User Log File and Status Log File.

8.5.3.4 ShmMem File: CER4.1-4.2P2_ShmMem

The ShmMem File exists to satisfy the Toolkit requirements and is not actively used by CER4.1-4.2P2.

8.5.4 Solutions to Possible Problems

The most likely problems encountered are missing input or ancillary data files, or existing output files. These should be identified in the Status Log File. These errors could also be linked to missing .met files or other problems related to a temporary file needed to process metadata. As mentioned in Section 8.4.4, all output files are opened with Status = NEW in Subsystem 4.1 software. Prior to any reprocessing, please run the Cleanup script.

8.5.5 Conditions for Subsystem and/or Target PGE(s) Terminal Failure (Halt all further processing)

a. Subsystem Termination

   There are no foreseeable Subsystem terminating conditions at this time. If one day fails, continue processing the next day.

b. Target PGE Termination

   There are no foreseeable Subsystem terminating conditions at this time. If the day fails, continue processing.

8.6 Expected Output Datasets

The expected Output Datasets are listed below for each instance of the PGE. This PGE is expected to process 31 times, maximum, in a 31 day month per satellite.

9.4 Operating Procedures

The PGE CER4.1-4.2P3 production script, **Run.CER4.1-4.2P3**, references a Process Control File (PCF) which contains the correct file names and paths for the PGE. This PCF can be created by first sourcing the cloud retrieval-specific environment script, **CER4.1-4.env** then executing the PCF generator **CER4.1-4.2P3.PCFGen**.

9.4.1 How to Generate the PCF File

The environment script requires two optional command-line arguments: 1-digit satellite (X) and character string prefix to production strategy (N). The default satellite is TRMM, 1-NOAA09, 2-TRMM, 3-Terra, and 6-Aqua. The prefix is usually Subset that generates special processing where only data in CERES validation regions is used. The PCF generator, **CER_4.1-4.2P3.PCFGen**, requires three command-line arguments: 4-digit year (YYYY), 2-digit month (MM), and 2-digit day (DD)

At the command-line (>) type:

> source $CERESHOME/clouds/bin/CER4.1-4.env X N
> $CERESHOME/clouds/bin/CER4.1-4.2P3.PCFGen YYYY MM DD

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.2P3_PCFin_$SS4_3_$PS4_3_$CC4_2P3.YYYYMMDD
CER4.1-4.2P3_PCF_$SS4_3_$PS4_3_$CC4_2P3.YYYYMMDD

9.4.2 How to Execute the Main Processor

Execute the production script by typing the script name, **Run.CER4.1-4.2P3**, followed by the PCF file name including directory.

At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>$CERESHOME/clouds/bin/Run.CER4.1-4.2P3 $CERESHOME/clouds/rcf/
CER4.1-4.2P3_PCF_$SS4_3_$PS4_3_$CC4_2P3.YYYYMMDD

9.4.3 Special Case Considerations

Special case considerations will be handled on a case-by-case basis, where special instructions will accompany each special request.

9.4.4 Special Reprocessing Instructions

All output files are opened with Status = NEW in Subsystem 4.1 through 4.4 software. The output from previous runs must be removed before reprocessing. A cleanup script has been provided as a convenience. It is to be run prior to reprocessing.

At the command-line (>) type:

>cd $CERESHOME/clouds/bin
>$CERESHOME/clouds/bin/Run.CER4.1-4.Cleanup $CERESHOME/clouds/rcf/CER4.1-4.2P3_PCF_$SS4_3_$PS4_3_$CC4_2P3.YYYYMMDD

The cleanup script uses the PCFile from the PCFile Generator to identify files to be removed.

9.5 Execution Evaluation

9.5.1 Exit Codes

The processor CER4.1-4.2P3 terminates using the CERES-defined EXIT CODES for the Langley TRMM Information System (LaTIS) as seen in Table 9-5. Other Exit Codes may appear from the program, which may be the result of a system, compiler, or Toolkit related error. In these cases, contact the responsible person (see Table 1-1) for assistance.

Table 9-5. Exit Codes for CER4.1-4.2P3

Exit Code	Definition	Action
0	Normal Exit	Proceed normally
Other	Failure	Call responsible persons

9.5.2 Screen Messages

When running the production script, Run.CER4.1-4.2P3, the system message, "No match," may be written to the screen. This message occurs when the scripts try to remove an old output file that does not exist. This does not signify a problem.

9.5.3 Log and Status Files Results

The Log files contain all error and/or status messages produced by the PGE. The files are located in directory: **$CERESHOME/clouds/data/runlogs**.

9.5.3.1 Report Log File: CER4.1-4.2P3_LogReport_$SS4_3_$PS4_3_$CC4_2P3.YYYYMMDD

The log report file contains informational messages for the PGE. They indicate progression through critical steps of the code or use of contingency code that will handle data problems. They point to algorithms that were executing when program problems occur. A comprehensive list of these messages, that can be generated during the execution of the PGE, is contained in Appendix B.

9.5.3.2 Status Log File: CER4.1-4.2P3_LogStatus_$SS4_3_$PS4_3_$CC4_2P3.YYYYMMDD

The Status Log File contains all messages created by the Toolkit and fatal processing messages. If an abnormal exit is encountered by the PGE, this file should be examined for '_F_', fatal message type. The responsible person should be advised.

9.5.3.3 User Log File: CER4.1-4.2P3_LogUser_$SS4_3_$PS4_3_$CC4_2P3.YYYYMMDD

The User Log File is not used at this time, but exists to satisfy the Toolkit requirements. Typically the _U_ and _N_ (User information and Notice) will be written to User Log File and Status Log File.

9.5.3.4 ShmMem File: CER4.1-4.2P3_ShmMem

The ShmMem File exists to satisfy the Toolkit requirements and is not actively used by CER4.1-4.2P3.

9.5.4 Solutions to Possible Problems

The most likely problems encountered are missing input or ancillary data files, or existing output files. These should be identified in the Status Log File. These errors could also be linked to missing .met files or other problems related to a temporary file needed to process metadata. As mentioned in Section 9.4.4, all output files are opened with Status = NEW in Subsystem 4.1 software. Prior to any reprocessing, please run the Cleanup script.

9.5.5 Conditions for Subsystem and/or Target PGE(s) Terminal Failure (Halt all further processing)

a. Subsystem Termination

   There are no foreseeable Subsystem terminating conditions at this time. If one day fails, continue processing the next day.

b. Target PGE Termination

   There are no foreseeable Subsystem terminating conditions at this time. If the day fails, continue processing.

9.6 Expected Output Datasets

The expected Output Datasets are listed below for each instance of the PGE. This PGE is expected to process 31 times, maximum, in a 31 day month per satellite.

These files are listed in the PCF file for offline purposes. Please ignore.

11.4 Operating Procedures (Procedure for each part of the processor's elements)

The PGE CER4.1-4.3P2 production script, **Run.CER4.1-4.3P2**, references a Process Control File (PCF) which contains the correct file names and paths for the PGE. This PCF can be created by first sourcing the cloud retrieval-specific environment script, **CER4.1-4.env** then executing the PCF generator **CER4.1-4.3P2.PCFGen**.

11.4.1 How to Generate the PCF File

The environment script requires two optional command-line arguments: 1-digit satellite (X) and character string prefix to production strategy (N). The default satellite is TRMM, 1-NOAA09, 2-TRMM, 3-Terra, and 6-Aqua. The prefix is usually Subset that generates special processing where only data in CERES validation regions is used. The PCF generator, **CER_4.1-4.3P2.PCFGen**, requires two command-line arguments: 4-digit year (YYYY), 2-digit month (MM).

At the command-line (>) type:

> source $CERESHOME/clouds/bin/CER4.1-4.env X N
> $CERESHOME/clouds/bin/CER4.1-4.3P2.PCFGen YYYY MM

The following files will be generated in **$CERESHOME/clouds/rcf/**:

CER4.1-4.3P2_PCFin_$SS4_3_$PS4_3_$CC4_3P2.YYYYMM
CER4.1-4.3P2_PCF_$SS4_3_$PS4_3_$CC4_3P2.YYYYMM

11.4.2 How to Execute the Main Processor

Execute the production script by typing the script name, **Run.CER4.1-4.3P2**, followed by the PCF file name including directory.

At the command-line (>) type:

>**cd $CERESHOME/clouds/bin**
>$CERESHOME/clouds/bin/Run.CER4.1-4.3P2 $CERESHOME/clouds/rcf/
CER4.1-4.3P2_PCF_$SS4_3_$PS4_3_$CC4_3P2.YYYYMM

11.4.3 Special Case Considerations

Special case considerations will be handled on a case-by-case basis, where special instructions will accompany each special request.

11.4.4 Special Reprocessing Instructions

All output files are opened with Status = NEW in Subsystem 4.1 through 4.4 software. The output from previous runs must be removed before reprocessing. A cleanup script has been provided as a convenience. It is to be run prior to reprocessing.

At the command-line (>) type:

>cd $CERESHOME/clouds/bin
>$CERESHOME/clouds/bin/Run.CER4.1-4.Cleanup $CERESHOME/clouds/rcf/CER4.1-4.3P2_PCF_$SS4_3_$PS4_3_$CC4_3P2.YYYYMM

The cleanup script uses the PCFile from the PCFile Generator to identify files to be removed.

11.5 Execution Evaluation

11.5.1 Exit Codes

The processor CER4.1-4.3P2 terminates using the CERES-defined EXIT CODES for the Langley TRMM Information System (LaTIS) as seen in Table 11-5. Other Exit Codes may appear from the program, which may be the result of a system, compiler, or Toolkit related error. In these cases, contact the responsible person (see Table 1-1) for assistance.

Table 11-5. Exit Codes for CER4.1-4.3P2

Exit Code	Definition	Action
0	Normal Exit	Proceed normally
Other	Failure	Call responsible persons

11.5.2 Screen Messages

When running the production script, Run.CER4.1-4.3P2, the system message, "No match," may be written to the screen. This message occurs when the scripts try to remove an old output file that does not exist. This does not signify a problem.

11.5.3 Log and Status Files Results (Include ALL Log Files)

The Log files contain all error and/or status messages produced by the PGE. The files are located in directory: **$CERESHOME/clouds/data/runlogs**.

11.5.3.1 Report Log File: CER4.1-4.3P2_LogReport_$SS4_3_$PS4_3_$CC4_3P2.YYYYMM

The log report file contains informational messages for the PGE. They indicate progression through critical steps of the code or use of contingency code that will handle data problems. They point to algorithms that were executing when program problems occur. A comprehensive list of these messages, that can be generated during the execution of the PGE, is contained in Appendix B.

11.5.3.2 Status Log File: CER4.1-4.3P2_LogStatus_$SS4_3_$PS4_3_$CC4_3P2.YYYYMM

The Status Log File contains all messages created by the Toolkit and fatal processing messages. If an abnormal exit is encountered by the PGE, this file should be examined for '_F_', fatal message type. The responsible person should be advised.

11.5.3.3 User Log File: CER4.1-4.3P2_LogUser_$SS4_3_$PS4_3_$CC4_3P2.YYYYMM

The User Log File is not used at this time, but exists to satisfy the Toolkit requirements. Typically the _U_ and _N_ (User information and Notice) will be written to User Log File and Status Log File.

11.5.3.4 ShmMem File: CER4.1-4.3P2_ShmMem

The ShmMem File exists to satisfy the Toolkit requirements and is not actively used by CER4.1-4.3P2.

11.5.4 Solutions to Possible Problems

The most likely problems encountered are missing input or ancillary data files, or existing output files. These should be identified in the Status Log File. These errors could also be linked to missing .met files or other problems related to a temporary file needed to process metadata. As mentioned in Section 11.4.4, all output files are opened with Status = NEW in Subsystem 4.1 software. Prior to any reprocessing, please run the Cleanup script.

11.5.5 Conditions for Subsystem and/or Target PGE(s) Terminal Failure (Halt all further processing)

a. Subsystem Termination

There are no foreseeable Subsystem terminating conditions at this time.

b. Target PGE Termination

There are no target PGEs to this PGE.

12.4 Operating Procedures

The PGE CER4.1-4.4P1 production script, **Run.CER4.1-4.4P1** takes up to 4 command-line parameters.

Parameter 1 = YYYY (four digit year)
Parameter 2 = MM (two digit month)
Parameter 3 = <Data Pathname> (full path name to where data is located) Usually $CERESHOME/clouds/data/input/<$IMAG>.
Parameter 4 = DD (two digit day). Restart capability. Can re-start processing at a given day. Optional, if not present, processing starts at day 01.

12.4.1 How to Execute the Main Processor

Execute the production script by typing the script name, **Run.CER4.1-4.4P1**, followed by the desired parameters.

At the command-line (>) type:

>cd $CERESHOME/clouds/bin

Special case considerations will be handled on a case-by-case basis, where special instructions will accompany each special request.

12.4.3 Special Reprocessing Instructions

Prior to re-processing, the output from previous runs needs to be deleted from the archive. Currently there is no vehicle to capture version information in the filenames for the Subsetted imager data.

12.5 Execution Evaluation

12.5.1 Exit Codes

The processor CER4.1-4.4P1 terminates using the CERES-defined EXIT CODES for the Langley TRMM Information System (LaTIS) as seen in Table 12-4. Other Exit Codes may appear from the program, which may be the result of a system, compiler, or Toolkit related error. In these cases, contact the responsible person (see Table 1-1) for assistance.

0	Normal Exit	Proceed normally
Other	Failure	Call responsible persons

12.5.2 Screen Messages

When running the production script, Run.CER4.1-4.4P1, the system message, "No match," may be written to the screen. This message occurs when the scripts try to remove an old output file that does not exist. This does not signify a problem. It may also indicate that there is no imager data staged.

12.5.3 Log and Status Files Results

At this time, there are no log files produced by this PGE.

12.5.4 Solutions to Possible Problems

At this time there are no possible errors for which solutions can be guessed.

12.5.5 Conditions for PGE and/or Target PGE(s) Terminal Failure

a. PGE Termination

   Since PGE processes a month of Imager data at a time, a restart capability was added to account for situations that cause problems. If a particular granule of Imager data causes problems, remove the granule from disk and restart the processing on the data day of failure and notify Subsystem analysts of problem.

b. Target PGE Termination

   If the PGE fails, a subset Imager data set will not be produced for that granule. If none is produced for the granule, target PGEs cannot be processed using that granule.

12.6 Expected Output Datasets

The expected Output Datasets are listed below for each instance of the PGE. This PGE is expected to process once per month per satellite. At this time, this PGE cannot produce the Subset Imager data for MODIS.

These messages are used to inform the operator or analyst of specific circumstances encountered during data processing. These messages may be strictly informative (Error Type = Status or Warning), or may indicate a fatal condition that results in premature PGE termination (Error Type = Fatal). All messages are written to the LogReport file and/or the LogStatus File of the processing instance.

Operator Instructions:

If a PGE prematurely terminates, then take the following steps:

1. Look at the last few records in the LogStatus file.
2. Find the error message in the following Error Message listing(s), and follow the appropriate ACTION.
3. If an error message is not in the LogStatus File, then repeat steps 1 and 2 using the LogReport File.
4. If no information is derived, then call the responsible person in Table 1-1.
5. If the appropriate ACTION failed, then call the responsible person in Table 1-1.

6. In all cases, log all steps that were taken after the PGE failure, and send a copy to the responsible person listed in Table 1-1.

Action Keys for Table B-1: (Note if an ACTION does not work, call the Responsible Person in Table 1-1.)

1. Problem Reading PCF File
   Ensure that PCF file for this run was properly created.
   If evidence of corruption, recreate PCF file and start job again.
   If still not successful, call the Responsible Person in Table 1-1.

2. Problem reading surfmapIO index file
   Check file for existence from logical ID 200 of PCF.
   If evidence of corruption, reload file.
   If still not successful, call the Responsible Person in Table 1-1.

3. Problem reading NSIDC HDF file
   Check file for correct date in the specified directory from 1.3.1.
   If evidence of corruption, reload NISE_SSMIF13_YYYMMDD.HDFEOS.
   If still not successful, call the Responsible Person in Table 1-1.

Appendix D
Subsystem Environment File

One sample Environment Script is provided. It is located in **$CERESHOME/clouds/bin**, is named '**CER4.1-4.env**' and contains the following environment variables:

SAT - Platform
INST - Instrument
IMAG - Imager

SS1	SS12	SS4_0	SS4_1	SS4_2	SS4_3	SS4_4
PS1	PS12	PS4_0	PS4_1	PS4_2	PS4_3	CV
CC1	CC12	CC4_0P1	CC4_1P1	CC4_1P2	CC4_1P3	CC4_1P4
CC4_1P5	CC4_2P1	CC4_2P2	CC4_2P3	CC4_3P1	CC4_3P2	CC4_1
CC4_3						

The SS variables refer to a Subsystem specific Sampling Strategy, the PS variables, its Production Strategy, and the CC variables, its Configuration Code. These variables take on different values depending on the SAT/INST/IMAG combination. For instance, processing of TRMM data requires Edition2 IES's whereas processing Terra data requires Alpha IES's. The values for the variables in the env file are set to values indicated for SSI&T. For Production processing, **the values for these variables must be set according to the values specified in the Production Request**, see Reference 2. The Sampling Strategy variables for SS4 are set according to the values for SAT, INST, and IMAG. The variable INST can, depending upon the satellite and processing request, take on the value of (NONE, FM1+FM2, FM3+FM4, FM1, FM2, FM3, FM4 or PFM). Each value for INST will cause different things to occur:

NONE	Cloud Retrieval Only Processing (no Convolution)
Multi INST (FM1+FM2, FM3+FM4)	Produce individual instrument version of 4.4 products CER_FQC, CER_FQCI, and CER_SSFI
Single INST (FM1,FM2,FM3,FM4,PFM)	Produce only those instrument specific products CER_FQC, CER_FQCI, and CER_SSFI

In order to facilitate processing of multiple satellites in various configurations, several parameters can be added to the command to source the env file. The first optional parameter dictates which Satellite to process and is implemented as follows:

> source $CERESHOME/clouds/bin/CER4.1-4.env <data_type>

where, for processing Clouds data, <data_type> can take on the values (**1, 2, 3, or 6**) where:

1 = NOAA9
2 = TRMM
3 = Terra
6 = Aqua

If no parameter is given, the env script defaults to the TRMM case (2).

If Subset processing by CERES Validation Region is desired, a second, optional parameter is passed when sourcing the env file. (Subset imager data must already be staged and, in the case of VIRS data, renamed appropriately using the Rename script).

> source $CERESHOME/clouds/bin/CER4.1-4.env <data_type> Subset

This will trigger Subset processing by CERES Validation Region in convolution. If processing in Subset mode, the <data_type> parameter **must** be specified.
