Introduction

Laboratory patch LR*5.2*267 provides partial implementation of the ISBT 128 barcode capability, and a fix for a problem with the option Pediatric unit preparation [LRBLPED]. A partial implementation is provided at this time in order to remain current with best practice policies, the new international standard, and to allow sites to process ISBT128-labeled units in a normal manner without a manual workaround. A full implementation shall be provided in a future product release.

The International Society of Blood Transfusion (ISBT) established a working group on automation and data processing to establish a replacement for the currently used ABC Codabar, which has reached a useful limit in a world of increasing information complexity. Code 128 was chosen because it codes more data into a smaller space, easily handles alphanumeric data, provides for internal scanning error checks, and supports concatenation (allows reading more than one barcode symbol with a single scan). The ISBT work group was joined by the American Association of Blood Banks (AABB), the American Red Cross (ARC), the Department of Defense (DoD), and the Health Industry Manufacturers Association. As a result, ISBT 128 was adopted as an international standard.

A deficiency in the option Pediatric unit preparation [LRBLPED] is also being corrected. Previously, this option allowed users to create new unit records containing blood product from existing units. However, in the creation of the records, new units were not assigned a division to which they should belong. As a result, units created through this option were unusable in the rest of the system. This option is fixed so that each unit created will be assigned the division of the creating user.

Scope of This User Guide

This ISBT User Guide provides instructions and a description of changes for those options that are affected by patch LR*5.2*267. This guide is not designed to be fully inclusive of all functionality associated with any particular option described. For additional setup and operating information, refer to the original Blood Bank Software User Manual V. 5.2, distributed in October 1994.

This user guide can be used as an example to follow when scanning and performing manual entries of ISBT 128 labels. Although the software has been altered to enable the reading of ISBT 128 labels as well as Codabar labels, the methods of using the software have not changed significantly. The most significant change is to accommodate the 13-character Unit ID present with ISBT 128- labeled units, while still maintaining a readable display of information presented to the user. Additional changes of significance affect the functionality associated with creating Divided units using the option Disposition – not transfused [LRBLIDN] and Pediatric unit preparation [LRBLPED].

Note: It should be noted that the behavior of these two options is different depending upon whether the original (parent) unit is labeled as ISBT 128 or Codabar.

Associated Documents Released with Patch LR*5.2*267

The release of patch LR*5.2*267 is accompanied by the release of the following documents in addition to this ISBT 128 User Guide:

- Appendix C to the ISBT User Guide-Test Plan. This appendix is released as a separate document. This document contains:
    - Test scripts reflecting normal conditions of options affected by changes in LR*5.2*267 using both ISBT 128 and Codabar examples. These test scripts can also be used as worksheets to document validation performed
    - Sample ISBT 128 labels that can be used to assist sites with validation of ISBT 128 functionality
    - Instructions for BLOOD PRODUCT File (#66) definitions for both the CODABAR and ISBT 128 product types used to create the test scripts
- Appendix E to the Blood Bank User Manual v 5.2. This is a revised version of Appendix E and is intended to replace the previously released Appendix E dated July 1996. This manual contains:
    - General guidance to be used for the validation of blood bank software
    - Details of control functions for all options in the VistA Blood Bank Software v 5.2
    - Sample forms for use in managing change control
    - Sample test case tracking worksheets
    - A Frequently Asked Questions (FAQ) section containing questions and answers to commonly asked questions concerning the VistA Blood Bank Software v 5.2.

Definitions

AABB
American Association of Blood Banks. This is a regulatory agency that focuses on quality practices within a blood bank and transfusion service.

ARC
American Red Cross.

CCB
Change Control Board. This is a governing body that reviews and approves functionality included in the blood bank software.

Code 128
Code 128 is a very high-density alphanumeric barcode that allows for more information to be coded into a small space and includes an internal check digit to prevent barcode misreads.

Codabar
The Codabar barcode font is used for various numeric barcoding applications including libraries, blood banks and parcels. Codabar was designed for character self-checking eliminating the requirement for checksum characters. However, checksum characters in the Codabar barcode are optional and they do maximize data integrity.

DoD

ISBT
International Society of Blood Transfusion.

ISBT 128
ISBT 128 is an international standard for the uniform labeling of blood products. It has many features, some of which are not being implemented at this time. The major features are:

- Highly structured Product Description (i.e. product naming convention)
- Highly structured Donation Identification Number (collection information embedded within Unit ID barcode)
- Strict standards as to the layout of a blood product label
- Expanded information embedded within the ABO/Rh label
- Standard format for the expiration date label
- Supports concatenation—that is the reading of two barcodes using one scan
- Utilizes Code 128 symbology for barcodes as opposed to Codabar

SRS
Software Requirements Specification. This is a document that details the functionality included in a software application.

VBECS
VistA Blood Establishment Computer Software. The name of the proposed replacement for the current VistA Blood Bank Software v 5.2.

VISTA

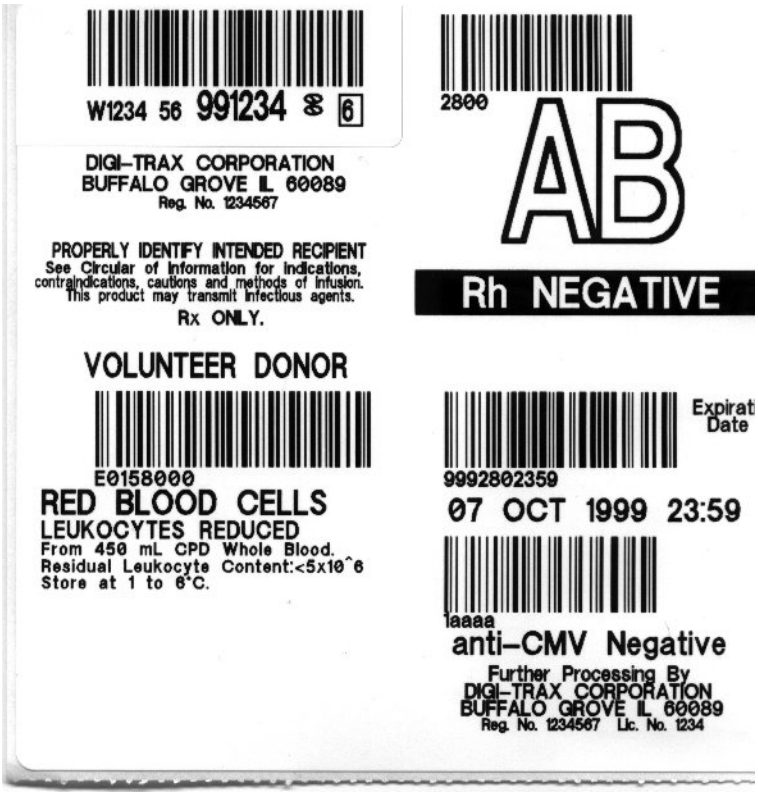
SAMPLE ISBT 128 BARCODE LABEL



Description of Software Changes

- The field length for the BLOOD INVENTORY File (#65) field UNIT ID (#65,.01) and the BLOOD PRODUCT File (#66) field PRODUCT CODE (#66,.05) have been modified to accept the longer Unit ID and Product Codes that are ISBT 128 uses.
- A new field in the BLOOD PRODUCT File (#66) to establish a relationship between ISBT 128 product codes and Codabar product codes has been added. Logic has been added to the input transform of the BLOOD PRODUCT File (#66) field MODIFY TO (#66.03,.01) to restrict modifications of ISBT 128 units to other ISBT 128 blood component types. The logic also restricts the modification of Codabar units to other Codabar unit types.
- The ability to read and interpret the various ISBT 128 barcodes has been provided, but sites will be required to maintain ISBT 128 component types within the current BLOOD PRODUCT File (#66) structure. Unit ID, ABO/Rh., Product Code, and Expiration Date barcode labels are now supported. None of the additional information that is embedded within the ISBT 128 barcode labels can be extracted.
- Sites creating pooled products will need to maintain off-line a system to name their pools using the ISBT 128 standards but VistA will be able to accept those pool names. This is consistent with the current Codabar functionality.
- VistA Blood Bank Reports and displays will be adjusted to accommodate the longer field lengths.
- On-demand printing of full-face blood bag labels is not supported. Sites will need to purchase pre-printed labels for products modified in the facility. (See International Council for Commonality in Blood Banking Automation(ICCBBA) GUIDANCE FOR INDUSTRY—United States Industry Consensus Standard for the Uniform Labeling of Blood and Blood Components using ISBT 128, Sec. 4.5).
- No enhancements have been made to the current VistA Donor package to bring it into ISBT 128 compliance since there will be no Donor support in the VistA Blood Establishment Computer Software(VBECS).
- The current Codabar parser has been modified to recognize an ISBT 128 unit and an additional parser routine has been written to interpret these barcodes.
- Current user and technical reference documentation has been issued to reflect the new partial ISBT 128 labeling standard.

Specific File and Field Changes

Because of time constraints and FDA regulations regarding changes made to a cleared medical device, the current application can only partially implement the ISBT 128 system. However, these changes will enable sites to process blood components labeled using ISBT 128 with the same level of confidence that the current Codabar system provides. The additional features provided by the ISBT 128 system will be implemented at a future date. Minimal changes have been made to the following files/fields to accommodate ISBT 128:

BLOOD PRODUCT File (#66) changes:

New fields:

IS ISBT128 (#66,.29): Required field is a set of codes—Yes or No. This field indicates whether the product type belongs to ISBT 128 or to Codabar. All product types fall into one of two categories: Codabar or ISBT 128. This field identifies the symbology to which each product type belongs. During installation of this patch, all current entries of the BLOOD PRODUCT File (#66) will be set to NO.

EQUIVALENT PRODUCT (#66,9): This field points to the blood product (of the opposite symbology) that most closely matches or is equivalent to the specified blood product. It screens on the IS ISBT field and allows only blood products of opposite symbologies to be stored as equivalent products. For any ISBT 128 products, only products with IS ISBT = NO (Codabar products) can be selected. The same is true for Codabar units; only blood products with IS ISBT = YES (ISBT 128 products) can be selected. Although not required, assigning a value to this field when creating ISBT 128 product types will assist in the data conversion that will be done when migrating to a new Blood Bank application.

Changes made to existing fields:

PRODUCT CODE (#66,.05): Maximum field length increased to accommodate the 8 character ISBT 128 product code.

MODIFY TO (#66.03,.01): Additional screen entered to restrict choices to BLOOD PRODUCT File (#66) entries of the same symbology, based on the entry of the IS ISBT128 field of the parent and possible child product types.

PEDIATRIC PRODUCT (#66,.22): Additional screen entered to restrict choices to BLOOD PRODUCT File (#66) entries of the same symbology, based on the entry of the IS ISBT128 field of the parent and possible child product types.

BLOOD INVENTORY File (#65) changes:

Changes made to existing fields:

UNIT ID (#65,.01): Maximum field length increased to accommodate the 13 character ISBT 128 Donation Identification Number.

PEDIATRIC ALIQUOT MADE (#65.16,.01): Maximum field length increased to accommodate the 13 character ISBT 128 Donation Identification Number.

UNIT ID (#65.091,.02): This is the UNIT ID's of child units created from a parent unit through modification. Maximum field length increased to accommodate the 13-character ISBT 128 Donation Identification Number.

LAB DATA File (#63) changes:

Changes made to existing field:

COMPONENT ID (#63.017,.03): This is where the UNIT ID of a transfused unit is stored for a patient. Maximum field length increased to accommodate the 13-character ISBT 128 Donation Identification Number.

ISBT 128 Barcode Characteristics for U.S. Implementation

The following topics discuss the reasons for changing to ISBT 128 barcodes, and specific characteristics of ISBT 128 labels and coding formats.

Codabar Limitations and the Code 128 Character Set

Codabar Product Codes were originally designed as five-digit structured codes. Characters one through three described the product's proper name, the fourth character described the anticoagulant, and the fifth character described any specifics as to the content. As product types became more numerous, the structure of this code could no longer accommodate the numbers of product types, and currently there is no longer any conformity to this standard. It became obvious that a new standard would need to be devised.

There is a lack of consistency between various blood collection agencies as to how they implemented the Codabar unit ID barcode label. Although the Codabar unit ID reads only as a numeric, the visual interpretation must be calculated based on the labeling preferences of the specific blood collection facility. For example, a Codabar unit ID that scans as 0316165 can be visually interpreted as either G16165 or 0316165, and the unit of blood may also have appended to it a two-digit, eye-readable prefix in the range of 01-99. This demonstrates that the Codabar Unit ID as scanned can have multiple visual interpretations.

There is also a lack of consistency between the various blood collection agencies regarding the implementation of the Codabar expiration date label.

ISBT 128 uses Code 128 barcode symbology, which recognizes a larger character set, allowing more information to be included in the barcode. The new standard was created to standardize all aspects of blood components labeling, thereby creating a system that is consistent, expandable, predictable, and that provides for the unique identification of any blood component for a period of 100 years.

Component Elements of ISBT 128 Barcodes

Donation Identification Number (Unit ID)—Data structure *αpppp yy nnnnnn*

- Located at the uppermost left of the blood component label.
- The barcode consists of 13 data characters, a data identifier and flag characters. The data identifier is embedded within the barcode and is used to identify the type of barcode being scanned.
    A. ***αpppp***—designates the country and collection facility.
    B. ***yy***—designates the year in which the donation or collection was made.
    C. ***nnnnnn***—is the serial number associated with the donation or collection.
- Provides for the unique identification of any donation or collection world-wide for a one hundred year period.
- An additional check digit calculated on the 13 data characters is printed in a box to the right of the Donation Identification Number. In a future application this will be used to validate the accuracy of manual data entry.

- A hidden data identifier is embedded within the barcode to identify the barcode as a Donation Identification Number barcode.
- Flag characters (displayed either rotated 90 degrees or in icon format) are the last two characters of the Donation Identification Number data structure. They are not part of the Donation Identification Number. In the US application of ISBT 128, these will always default to 00. As recommended by the US Industry Consensus Standard for ISBT 128, the current application will ignore them from the scanned data input.
- Example of typical ISBT 128 Donation Identification Number: W123401123456

Product Code—Structure *E0000tds*:

- Located at the center-left of the blood component label.
- The barcode consists of 8 characters plus a hidden data identifier. The data identifier is embedded within the barcode and is used to identify the type of barcode being scanned. The structure of the 8 character code is as follows:
  - ***E0000***—5 characters used for the product description. This is a random number assigned to a specific product type by the ICCBBA. E was chosen as the first alpha character to be used since A, B, C and D were used by Codabar as start/stop characters.
  - ***t***—One character to designate the type of donation or collection/intended use.
  - ***ds***—provides information about the division of a product. Will be 00 unless the unit has been split from a parent unit.
  - Example of typical Product Code, using AS-1 Red Blood Cells as the example: E0291000

ABO/Rh Blood Groups—Structure *ggre*

- Located at the uppermost-right of the blood component label.
- The barcode consists of 4 characters plus a hidden data identifier. The data identifier is embedded within the barcode and is used to identify the type of barcode being scanned.
  - ***gg*** - designates the ABO and Rh group according to a table supplied by ICCBBA.
  - ***r*** - designates special testing but is not used in the US Implementation and will default to 0.
  - ***e*** **-** is reserved for future use and will default to 0.
- The ISBT 128 ABO/Rh group codes are expanded from the current Codabar codes, and in the US implementation, information about the type of donation/intended use is included in the ABO/Rh blood group barcode. The current application will only extract the ABO and Rh blood group information from this label.
- Example of a typical ISBT 128 ABO/Rh barcode using O Pos as the example:
  5100

Expiration Date/time—Structure *cyyjjjhhmm*

- Located in the center-right of the blood component label.
- The barcode consists of 10 data characters plus a hidden data identifier. The data identifier is embedded within the barcode and is used to identify the type of barcode being scanned.
- ***c*** - designates the century (e.g. 9 for 1999,0 for 2000)
- ***yy*** -- designates the year
- ***jjj*** -- is the julian date (the number of the day in the year)
- ***hh*** -- specifies the hour (0-23)
- ***mm --*** specifies the minutes (00-59)
- an example of a coded expiration date would be: 0011422359
- The structure of the displayed expiration date is: DD MMM YYY HR:MIN
- The US Implementation always will include the time in the data structure. When not a time dependent blood product, the time is encoded as 23:59. When this 23:59 time is used, it is not necessary that this time be displayed in the barcode text and a midnight time should be assumed.
- An example of a displayed expiration date would be 22 MAY 2001 23:59.

Special Testing -Structure *1ααααα*

- Located in the bottom most right of the blood component label.
- Consists of 5 data characters plus a hidden data identifier. The data identifier is embedded within the barcode and is used to identify the type of barcode being scanned.
- In the US Implementation, only anti-CMV status will be encoded here.
- This barcode will be utilized in a future application and will not be interpreted by the current software.

NOTE: In ISBT 128, there is no FDA Registration facility barcode. The identification of the collection facility is embedded within the Donation Identification Number.

Structure of ISBT 128 Blood Product Description

Although there is no structure to the five-character ISBT 128 Product Code, the ISBT 128 Labeling Standard does provide a very structured format for the Blood Product Description. All blood component names follow the following format:

Blood Component|Core Condition|Other Attributes|Other Attributes

Any blood component can also have one or more modifiers in addition to a core condition and other attributes. Depending on the amount of further processing that is done on any particular blood component, this Blood Product Description may become very long. Due to the constraints of the current VA FileMan system, it will not be practical to attempt to use the ISBT 128 Blood Product Description as the NAME field in the BLOOD PRODUCT File (#66) when creating new entries for some of these ISBT 128 product types.

An example of the ISBT 128 Blood Product Description for an AS-1 Red Blood Cell component would look like this:

RED BLOOD CELLS|AS1/450mL/refr
The ISBT 128 Product code is E0291000

An example of the ISBT 128 Product Description for this same AS-1 Red Blood Cell component after processing into an irradiated and leuko-poor component would be:

RED BLOOD CELLS|AS1/450mL/refg|Irradiated|ResLeu:<5log6
The ISBT 128 Product Code is now E0307000

Definitions of Terms:

1. BLOOD COMPONENT: Consists of the component class (required) and any modifiers (optional)
    A. COMPONENT CLASS: General description of the cellular and/or non-cellular product having a unique set of core conditions, e.g. Red Blood Cells, Whole Blood, Plasma, Platelets
    B. MODIFIER: A description that relates to the core conditions of a blood component class that distinguishes it from other members of the same component class, e.g. Frozen, Frozen Rejuvenated, Washed.

2. CORE CONDITIONS: Consists of three parts, anticoagulant or additive if present, nominal volume of original collection and relevant storage temperature. These are delimited by the slash "/", e.g. AS3/450 ml/refr

3. OTHER ATTRIBUTES: A blood product may be further defined by the inclusion of attribute variables from one or more attribute groups. Unless otherwise stated, the default state of a product is assumed, e.g. is intended for transfusion and was prepared in a closed system, not exposed to radiation, not leuko-reduced etc. Other Attributes are organized into the following groups:
    A. Intended Use.
    B. System Integrity.
    C. Irradiation.
    D. Residual Leukocyte Count.
    E. Altered.
    F. Final Content.
    G. Additional information on preparation.
    H. Apheresis.
    I. Quarantine.
    J. Pools - number of donors in a pool or approximate number of platelets in pool.
    K. Method of treatment.

Implementing Changes Introduced By LR*5.2*267

PREPARATION FOR INSTALLATION OF LR*5.2*267

No advance site preparation is necessary prior to the installation of LR*5.2*267.

Prior to installation of the patch, it is recommended that blood bank users should read this user guide along with the Laboratory V. 5.2 ISBT User Guide – Appendix C - Test Plan. Installation and validation should first be undertaken in a mirrored test account if at all possible. Sample ISBT 128 labels are included in the Laboratory V. 5.2 ISBT User Guide – Appendix C - Test Plan for your convenience in creating sample ISBT 128 blood product types.

BARCODE SCANNER CONSIDERATIONS

Use of a barcode scanner in the blood bank is recommended in order to achieve the maximum benefits of the software and to improve accuracy and safety. Currently in the field the barcode scanners in use are only required to read and interpret Codabar symbology. In order to process blood components using the ISBT 128 standard, it is necessary that the blood bank have a scanner that can auto-discriminate between Codabar and Code 128 symbologies; that is, be able to read both types of symbologies without the need to alter the setup of the scanner for each symbology. The sample ISBT 128 labels that are included in the Laboratory V. 5.2 ISBT User Guide – Appendix C - Test Plan can be used to test the ability of your scanner to do this. Refer to the setup manual that came with your scanner or contact the manufacturer for additional guidance. Scanners should be configured to automatically execute a carriage return after each scan. The following scanners were used in the development and testing of patch LR*5.2*267:

- Symbol Technologies LS 2000MX
- Symbol Technologies LS 4000i

OVERVIEW OF FUNCTIONAL CHANGES:

Changes in the blood bank software function after installation of patch LR*5.2*267 are:

- The option Edit blood product file [LRBLSEB] prompts for the two new fields in the BLOOD PRODUCT File (#66). These new fields are the IS ISBT128 (#66,.29) and the EQUIVALENT PRODUCT (#66,9) fields.

- The option Edit blood product file [LRBLSEB] prompts for the ASSOCIATED DIVISION field (#66.1,.01) earlier in the definition of a new blood product. It is prompted for immediately after the IS ISBT128 field (#66,.29).

- Prior to installation of LR*5.2*267, for prompts designed to accept scanner input, the screen echoes what the scanner literally reads and then re-displays the interpretation of the reading. After installation of this patch, users may notice that the echo of the literal scanned input may display for a split second and be erased prior to the display of the interpretation. This is normal and intentional. Users will notice this split-second display-erase-redisplay for data input at these prompts for both barcode and manual data entry.

- Changes are made to the option Disposition –not transfused [LRBLIDN] when processing an ISBT 128 product type into divided units. The system is designed to know if the parent unit is labeled using Codabar or ISBT 128 based on the entry in the IS ISBT128 field (#66,.29) in the BLOOD PRODUCT File (#66). Prior to processing an ISBT 128 blood component into aliquots, sites are required to create unique entries in the BLOOD PRODUCT File (#66) for each possible number of aliquots created. For example, if a site splits a component into three aliquots, three separate entries must be created in the BLOOD PRODUCT File (#66) for the divided products. The processing of a Codabar unit into divided products remains unchanged.

- Changes are made to the option Pediatric unit preparation [LRBLPED]. The system is designed to know if the parent unit is labeled using Codabar or ISBT 128 based on the entry in the IS ISBT 128 field (#66,.29) in the BLOOD PRODUCT File (#66). Prior to processing an ISBT 128 blood component into aliquots, sites are required to create unique entries in the BLOOD PRODUCT File (#66) for each possible number of aliquots created. Theoretically, this could be up to 26 since the Pediatric unit preparation option allows up to 26 aliquots to be created from a single unit. The creation of pediatric aliquots from a Codabar component remains unchanged.

- The option Pediatric unit preparation [LRBLPED] now assigns the division of the user to each pediatric aliquot created.

Setting Up a New Entry in the Blood Product File (#66):

The following instructions are being provided to assist sites in creating new entries into the BLOOD PRODUCT File (#66) using the option Edit blood product file [LRBLSEB]. The instructions may also be useful to assist sites in better understanding how entries in specific fields in this file affect the characteristics of specific blood components.

Several changes will be noted in the Edit blood product file [LRBLSEB] option after installation of patch LR*5.2*267:

- A new required field has been added called IS ISBT 128 (#66,.29). This is a YES/NO field . As part of the installation process of LR*5.2*267, a value of NO is assigned to all existing records in this file.
- A new field has been added called EQUIVALENT PRODUCT (#66,9). This field is a pointer to the BLOOD PRODUCT File (#66). It is screened to allow only BLOOD PRODUCT File entries with non-identical entries in the IS ISBT 128 field.
- The input template for this option now prompts for input of the ASSOCIATED DIVISION field (#66,10) immediately after the IS ISBT 128 field.

The most significant difference between setting up a blood component labeled using ISBT 128 as opposed to one labeled using Codabar is in the definition of fields in the SUPPLIER multiple. In Codabar, because of the possibility of an eye-readable prefix, and totally numeric vs. alpha characters and any combination of these components being processed at a site, separate entries in the SUPPLIER multiple were recommended for each component type defined. This ensured that scanning of the Unit ID field would be interpreted properly when used in conjunction with the proper SUPPLIER multiple entry. In ISBT 128, the Unit ID field format is consistent, therefore, multiple SUPPLIER entries for any specific ISBT labeled product are only necessary if the site has different sources of the same component and wishes to track separate costs.

NOTE: See Appendix A for the current listing of American Red Cross (ARC) collection facilities, prefixes, and FDA registration numbers.

BLOOD PRODUCT FILE #66

NAME Field # .01: This is the name of the specific product. Although the field allows 40 characters, the most relevant information should be contained within the first 30 characters. Because of the limitations of the current file structure and how FileMan is used for sorting file entries, it may not be practical to enter the official ISBT 128 Product Description as the BLOOD PRODUCT NAME. In this application, the PRODUCT CODE will be the key entry to define a specific blood product, whether it is Codabar or ISBT 128 labeled.

ABBREVIATION Field # .02: A shortened name for a blood product-- must be between 1-4 characters. Can be used to lookup an existing entry.

CAN BE MODIFIED Field # .03: This is a yes/no field. If the blood component type can be modified into another blood component type, then a YES should be entered here.

IDENTIFIER Field # .04:
This field is a set of codes. Valid choices are:

> **BB**:COMPONENT/DERIVATIV (always choose **BB** when defining a new blood product)
> **AB**:ANTISERUM (not currently used by application)
> **T**:TEST PROVIDED (limited use, TYPING CHARGE entry only)

PRODUCT CODE Field # .05: This is the unique code assigned to a blood product. In Codabar, it is always a 5-number code. In ISBT 128, the product description is coded within the first five characters, the donation type is encoded within the 6th character and characters 7-8 are reserved to identify the split (aliquot) level. In this VistA application, we will not decode the 6th character, donation type, however it must be entered as provided by your blood supplier for the product to be scanned properly. If the product being defined is a divided or Pediatric product, a unique product code for each split (aliquot) level possible must be entered here in the format α0000tA0, α0000tB0, α0000tC0. In order to provide for uniqueness in the BLOOD INVENTORY File (#65), there must be a unique entry in the BLOOD PRODUCT File (#66) for each possible aliquot that can be prepared from a parent unit. The α0000t portion of the ISBT 128 product code must be the same as the parent unit, and each additional aliquot that can be prepared must follow the format A0, B0, C0, D0 in characters 7-8.

IS ISBT128 Field # .29: This is a new yes/no field. It is required and will be used in conjunction with the MODIFY TO field to restrict component modifications to blood components of like symbology. Answer YES if the blood component type is labeled using ISBT 128. Answer NO if the blood component type is labeled using Codabar.

Select **ASSOCIATED DIVISION Field # 10:** This is a required, multiple field and identifies the division(s) with which a specific blood component type can be associated.

> **ASSOCIATED DIVISION Field # 66.1,.01:** A separate entry must be made for each valid division within a multi-divisional institution that can receive and process a specific blood component type.

DOD CODE Field # .055: This field is not currently used.

MODIFICATION CRITERIA Field # .06: This field controls the software behavior when using the option Disposition –not transfused [LRBLIDN] to modify a blood component into another, different blood component. An entry is made in this field when defining the 'child' product type, not the parent. For example, D should be entered here if the product being defined is a Divided Unit.

PATIENT/PRODUCT ABO Field # .07: Choices are MUST MATCH or MUST BE COMPATIBLE. The entry here controls the checks that are made when selecting specific blood components for a patient. MUST MATCH will only allow units of the same ABO as a patient, MUST BE COMPATIBLE will allow selection of units based on currently acceptable ABO substitutions, based on the entry in the PATIENT/PRODUCT REQUIREMENT field for this product.

PATIENT/PRODUCT RH Field # .08: Choices are MUST MATCH or MUST BE COMPATIBLE. The response here controls the checks that are made when selecting specific blood components for a patient. MUST MATCH will only allow units of the same Rh as a patient, MUST BE COMPATIBLE will allow selection of units based on currently acceptable Rh substitutions, based on the entry in the PATIENT/PRODUCT REQUIREMENT field for this product. For plasma type components, it may be appropriate to leave this field null.

PATIENT/PRODUCT REQUIREMENT Field # .09: Choices are CROSSMATCH or PLASMA/PATIENT COMPATIBILITY. The entry here controls whether or not a specific component assigned to a patient must have a crossmatch interpretation of Compatible or INCOMPATIBLE, GIVE WITH BB DIRECTOR APPROVAL entered prior to relocation from the Blood Bank. If PLASMA/PATIENT COMPATIBILITY is selected, then only a check on the ABO/Rh of the patient and blood component type are made to determine if they are compatible according to standard accepted operating practices.

VOLUME (ml) Field # .1: A required field—based on the average volume for the specific component being defined.

EQUIVALENT PRODUCT Field # 9: This is a pointer field that can be used to associate an ISBT 128 product type to an existing Codabar product type. Although there is no current functionality associated with this new field, it will prove helpful in a future data conversion. When defining a new ISBT 128 product type, sites are encouraged to enter the previously defined equivalent Codabar product type (if applicable) in this field.

DAYS LEFT Field # .11: This is a number between .16 and 2557 that is used to calculate a proposed expiration date when creating this product from another in inventory. For example, a 1 entered here for a Thawed plasma product would have the software suggest an expiration date of 24 hrs in the future when using the option Disposition –not transfused [LRBLIDN] to thaw a frozen plasma product.

ANTICOAGULANT/ADDITIVE Field # .12: This is a set of codes: CPD, ACD, CPDA1 and ADSOL. When creating a pediatric component, a check is made to ensure that the parent and child component type have identical entries in this field.

COLLECTION/PREP HOURS Field # .13: This field is used by the donor module to determine if the component being created has been processed within the maximum allowable time from the date/time of collection.

MAXIMUM STORAGE DAYS Field # .135: This is the maximum storage type allowed for the specific blood component. The entry here is used to prevent an unacceptable expiration date to be assigned to a blood component when receiving a component into inventory using the option Log-in regular (invoices) [LRBLILR] or Disposition –not transfused [LRBLIDN]. It is also used when calculating the age of a unit of blood in inventory to determine if it is acceptable for Pediatric transfusion.

MODIFIED BEFORE RELEASE Field # .14: This is a yes/no field. An entry of YES is made here when the blood component must be modified before release, such as a frozen blood component, which must be thawed. If an entry of YES is entered, any units of this component type that are selected for a patient MUST be modified using the option Disposition –not transfused [LRBLIDN] prior to using the option Disposition –relocation [LRBLIDR] to issue the unit.

CAN BE REQUESTED Field # .15: This is a yes/no field. Only blood components with a YES entry in this field can be requested using options Specimen log-in [LRBLPLOGIN] or Blood component requests [LRBLPCS]. It is highly recommended that sites restrict choices by entering a NO here for any blood components not actively in use.

PATIENT SPECIMEN AGE ALLOWED Field # .16: For components that require pre-transfusion testing, a check is made to this field to determine the maximum specimen age allowable for the component. At the time of component request and selection, the current time is determined, the earliest allowable specimen date/time is calculated from the entry in this field, and the database is searched for a valid specimen.

RETYPE AFTER PREPARATION Field # .18: This is a yes/no field. Answer YES to this field if the component is prepared in the facility and must have ABO/Rh testing performed after preparation. A YES entry here will add newly created components to the Inventory ABO/Rh testing worksheet [LRBLIW] and prevent the components from being issued using the option Disposition –relocation [LRBLIDR] until ABO/Rh confirmation results are entered. When defining a blood component that will be the target component for Pediatric unit preparation [LRBLPED], the entry in this field must be YES.

CONTAINS RED BLOOD CELLS Field # .19: This is a yes/no field. If the component type contains red cells, answer YES here. A Yes here will control whether specific components are added to the Inventory ABO/Rh testing worksheet [LRBLIW], when components are received using the option Log-in regular (invoices) [LRBLILR].

MAX AGE FOR PEDIATRIC USE Field # .21: If this product can be used to prepare Pediatric Units for transfusion, enter the maximum number of days allowed from the date of collection to its use for pediatric unit preparation. The number entered here is used in conjunction with the unit expiration date and MAXIMUM STORAGE DAYS to determine whether the age of a unit is acceptable.

PEDIATRIC PRODUCT Field # .22: If the current product can be made into a Pediatric product, the entry here is the component that corresponds to the pediatric component. The entry must already exist in the BLOOD PRODUCT File (#66), the product name must contain the word PEDIATRIC (if Codabar) and the entries in the ANTICOAGULANT/ADDITIVE and IS ISBT128 fields must match. When defining this field for an ISBT 128 product type, enter the initial aliquot divided component (PRODUCT CODE α0000tA0) in this field.

SPECIFIC GRAVITY Field # .23: This is the specific gravity of the component and used to calculate the weight of a component from the volume. This calculation is done during Pediatric product preparation.

MAXIMUM INFUSION TIME(MIN) Field # .24: The number of minutes entered here is used to determine if a transfusion episode should be added to the Prolonged transfusion times [LRBLPIT] report. The date/time of transfusion completion is compared to the date/time of relocation and elapsed time is compared to the entry in this field for the component type. If the elapsed time is greater than the time entered, the transfusion episode is placed in a report queue.

AUTOLOGOUS/DIRECTED COMPONENT Field # .25: This is a yes/no field. If this specific component type is autologous or directed, answer YES here. A YES entry in this field will require that any components received during Log –in regular (invoices) [LRBLILR] be associated with a valid patient at the time of receipt. A valid patient is one who is entered in the VA PATIENT File (#2).

ADMINISTRATIVE CATEGORY Field # .26: This field consists of a set of codes to assist in defining a blood product into a specific category. The Blood Bank Administrative Data [LRBLA] report is sorted according to Administrative Categories.

POOLED PRODUCT Field # .27: This is a yes/no field.. If this product type is a pooled product, a YES must be entered here.

ASK BAG LOT Field # .28: This is a yes/no field. Enter YES here if this product is made from another in inventory and you wish to be prompted to record the bag lot # during preparation.

DESCRIPTION Field # 1: This is an optional word-processing field that can be used to enter a text description of the product.

Select SYNONYM Field # 2: : This is an optional free text field. An alternate name for a blood product up to 25 characters can be entered here. It can be used to lookup an existing entry.

Select MODIFY TO Field # 3: Multiple field. For each component type that can be made into other component types, enter the child component type in the MODIFY TO field and complete the NOT ONLY ONE ALLOWED field as applicable.

MODIFY TO Field # 66.03,.01: If this component type can be made into other component types, enter the child component type here. Prior to entry, the component type must have been previously defined as a valid entry in the BLOOD PRODUCT File and the entry for the IS ISBT128 fields must match.

NOT ONLY ONE ALLOWED Field # 66.03,.02: If more than one component type can be made from the parent, enter YES. For example, if the parent unit is whole blood, both a red cell and a plasma product can be created from it.

Select SUPPLIER Field # 4: : This is a multiple field, and at least one entry is required for each active blood component type in use at a site. How the sub-fields are defined in this section control how the UNIT ID barcode is interpreted when scanned. Depending upon your blood product supplier's practices, you may need one or many entries in this multiple field to properly interpret Codabar labeled units. The Red Cross, for example, may ship blood components all over the United States, and a SUPPLIER multiple entry should be created for each Red Cross collection facility in order for the correct eye-readable prefixes to be assigned at the time of unit log-in. In the case of the Red Cross, there is a one to one relationship between the collection facility/FDA Registration number and the eye-readable prefix, and this SUPPLIER multiple should be considered a COLLECTION FACILITY multiple. As your blood suppliers transition to ISBT 128 labeling, only one SUPPLIER multiple entry is needed for each ISBT 128 component type processed at your facility, unless you are supplied the same component type by multiple facilities and the component costs are different. However, creating multiple SUPPLIERS for the same component type allows a blood bank to track costs separately.

SUPPLIER Field # 66.01,.01: This is the free text name of the SUPPLIER/COLLECTION FACILITY.

SUPPLIER Preference number Field # 66.01,.001: This number is automatically assigned when the new SUPPLIER multiple entry is created and used internally by the software.

COST Field # 66.01,.02: This is the cost of the specific component charged by the specific supplier of the product. The number entered here is reflected in both the Supplier invoices (inventory) [LRBLRIN] and Supplier transactions (inventory) [LRBLRIT] reports.

ADDRESS LINE 1 Field # 66.01,.03: : This is the optional address of the supplier/collection facility

ADDRESS LINE 2 Field # 66.01,.04 :

ADDRESS LINE 3 Field # 66.01,.05: :

CITY Field # 66.01,.06: : This is the optional city of the supplier/collection facility

STATE Field # 66.01,.07: This is optional state of the supplier/collection facility

ZIP CODE Field # 66.01,.08: This is the optional zip code of the supplier/collection facility

PHONE Field # 66.01,.09: This is the optional phone number of the supplier/collection facility.

SUPPLIER PREFIX NUMBER Field # 66.01,.1: This is the eye-readable prefix that may be used by a supplier/collection facility using Codabar symbology to label units. The use of the eye-readable prefix is not consistent between all blood collection facilities, but it is consistent within a specific collection facility. If present, this is a 2-digit number that will always be appended at the beginning of the scanned Unit ID when processing units from this specific supplier during the option Log –in regular (invoices) [LRBLILR]. If the collection facility does not use an eye-readable prefix, OR if this is an ISBT 128 component type, leave this field null.

REGISTRATION NUMBER Field # 66.01,.11: This is the FDA Registration number assigned to a specific SUPPLIER/COLLECTION FACILITY. It is encoded on the lower-most right hand corner of a Codabar labeled blood bag. See Appendix A for a list of the American Red Cross Collection Facility Registration Numbers.

==>**NOTE:** There is no REGISTRATION NUMBER barcode on an ISBT 128 product. When defining an ISBT 128 product, leave this field null.

UNIT LABEL NON-STANDARD Field # 66.01,.12: This field is used to determine whether a Codabar-labeled unit contains alpha characters or is strictly numeric. Answer NO here if the component is labeled using Codabar and this SUPPLIER/COLLECTION FACILITY uses alpha characters in the Codabar Unit ID. If the SUPPLIER/COLLECTION FACILITY labels in Codabar using a totally numeric Unit ID OR the component is labeled using ISBT 128, enter YES here or leave NULL.

Select LOT # Field # 66.01,1: Multiple field—can be used if lot number and expiration dates of certain products are tracked.

LOT # Field # 66.02,.01: This is the lot number for the specific product being tracked.

EXPIRATION DATE Field # 66.02,.02: This is the expiration date of the lot number for the specific product being tracked.

CRITERIA FOR USE Field # 66,5: This is a free text word-processing field. Can be used to document criteria for the specific blood that has been defined by the facility. This field is not currently used by the Blood Bank application but was intended for future use. However, data entry here can be viewed using FileMan to inquire to the BLOOD PRODUCT File (#66).

Select TESTS TO CHECK Field # 6: This is a multiple field that can be used to define CH Subscripted tests whose most recent results will be compared to pre-defined criteria when this blood product is ordered, either through Specimen log-in [LRBLPLOGIN] or Blood component requests [LRBLPCS], and the user answers NO to the prompt “Is patient Pre-op”. If no previous results are available, or if previous results fall outside of the criteria defined, a message is displayed stating this and override is required to continue placing an order for this blood component. Additional fields are also prompted when the product order is placed after the override. The ordering episode is captured by the system and is available on the Inappropriate transfusion requests report [LRBLPRIT], which can be printed at any time.

TESTS TO CHECK Field # 66.04,.01: Name or Abbreviation of CH Subscript test to be evaluated

SPECIMEN Field # 66.04,.02: Site/Specimen type of CH Subscript test to be evaluated

> OR < TEST VALUE Field # 66.04,.03: Value of CH Subscript test to trigger message and override. The criteria AND the value must be entered here (i.e. >8).

REQUISITION INSTRUCTIONS Field # 66,7: This is a free text word-processing field that can be used to document requisition instructions. This text is displayed if a user answers YES to the prompt FOR TRANSFUSION REQUESTS: Display instructions for components? NO// when using options Specimen log-in [LRBLPLOGIN] or Blood component requests [LRBLPCS] to place an order for components.

Select PRE-OP TESTS TO CHECK Field # 66,8: This is a multiple field that can be used to define CH Subscripted tests whose most recent results will be compared to pre-defined criteria when this blood product is ordered, either through Specimen log-in [LRBLPLOGIN] or Blood component requests [LRBLPCS], and the user answers YES to the prompt "Is patient Pre-op?". If no previous results are available, or if previous results fall outside of the criteria defined, a message is displayed stating this and override is required to continue placing an order for this blood component. Additional fields are also prompted when the product order is placed after the override. The ordering episode is captured by the system and is available on the Inappropriate transfusion requests report [LRBLPRIT], which can be printed at any time.

PRE-OP TESTS TO CHECK Field # 66.08,.01: Name or Abbreviation of CH Subscript test to be evaluated

SPECIMEN Field # 66.08,.02: Site/Specimen type of CH Subscript test to be evaluated.

> OR < TEST VALUE Field # 66.08,.03: Value of CH Subscript test to trigger message and override. The criteria AND the value must be entered here (i.e. >45).

Select WKLD CODE Field # 66,500: This is the workload code specific to this component. An entry should be made here if this component is created in the facility, either through a donor program or through modification using the option Disposition – not transfused [LRBLIDN]. This is a multiple field.

WKLD CODE Field # 66.06,.01: This is a pointer to the WKLD CODE File (#64). The actual workload code is entered here if applicable.

Changes in Specific Options

The following section details specific changes observed in Blood Bank options after installation of LR*5.2*267.

BP Edit Blood Product File [LRBLSEB]

Following is an example of creating new entry in BLOOD PRODUCT file (#66) for an ISBT 128 labeled product. An AS-5 Red Blood Cell is used as the example.

The ISBT 128 Product Description for the product is RED BLOOD CELLS|AS-5/450mL/refr
The ISBT 128 product code is E0385V00.
The new or moved fields are underlined. User input is **bolded.**

LR Log-in Regular (Invoices) [LRBLILR]

The option Log-in regular (invoices) [LRBLILR] is modified to accept barcode scanner input from ISBT 128 ABO/Rh, Unit ID and product code barcodes. The ability to accept barcode scanner input from the ABO/Rh, Unit ID, product code and FDA Registration # barcode from Codabar labeled units as well as manual data entry remains unchanged.

Highlights of changes observed as a result of installation of patch LR*5.2*267:

Prior to this patch, when a barcode is scanned at prompts designed to accept scanner input, the screen echoes what the scanner literally reads and then displays the interpretation. After installation of this patch, the users may notice that the echo of the scanned input may display for a split second and be erased prior to the display of the interpretation. This is normal and intentional. Users will notice this split-second display-erase-redisplay for any data input at prompts that are designed to accommodate barcode data input, including manual data entry.

Workflow changes once your supplier begins transition to ISBT 128 labeled products

Sites may have created several SUPPLIER multiple entries for each blood product defined in the BLOOD PRODUCT File (#66) in order to accommodate multiple UNIT ID formats (multiple prefixes, numeric vs. alpha characters etc.). In addition, sites may have populated the REGISTRATION NUMBER Field (#66.01,.11) within the SUPPLIER multiple in order to scan the Codabar FDA Registration Number barcode to populate the SUPPLIER prompt when logging in units using this option. This practice will not be necessary when using the ISBT 128 system if the site has a single source for their blood products.

The ISBT 128 system has a consistent format for the structure of the Unit ID barcode, therefore, only a single entry in the SUPPLIER multiple for each component processed should be necessary in order to properly interpret the Unit ID barcode.

A situation that could require multiple SUPPLIER entries for an ISBT 128 blood product is the case where there is more than one source for the blood component. This could be the case in a multidivisional institution. In order to have accurate Blood inventory transaction reports [LRBLITX] and Supplier transactions (inventory) [LRBLRIT] it may be necessary to create multiple SUPPLIER entries for an ISBT 128 blood product.

An example of what is seen during processing of a shipment of ISBT 128 components after installation of LR*5.2*267 follows. A barcode scanner is used to scan ISBT 128 ABO/RH, Unit ID and Expiration date barcodes.

DN Disposition – Not Transfused [LRBLIDN]

The option Disposition –not transfused [LRBLIDN] is modified to accept barcode data input from an ISBT 128 Unit ID barcode. The ability to accept barcode data input from a Codabar Unit ID barcode as well as manual data entry remains unchanged. Changes in the logic used to create divided units from an ISBT 128 product type are included in this patch.

Highlights of changes observed as a result of installation of patch LR*5.2*267:

Prior to using this option to modify an ISBT 128 product into divided products, sites must create unique entries in the BLOOD PRODUCT File (#66) equal to the number of aliquots to be prepared. The PRODUCT CODE Field (#66,.05) for these new entries must be defined using the first six (6) characters of the parent unit, then appending A0, B0, C0, etc. for characters 7-8 for each divided product created.

The main differences between dividing a Codabar and an ISBT 128 product type are as follows:

Codabar: For each aliquot prepared, the system assigns a Unit ID the same as a parent to which it appends the letters A, B, C etc. to identify the specific aliquot. A single entry in the BLOOD PRODUCT File (#66) defining a Divided Unit is required.

ISBT 128: For each aliquot prepared, the system assigns a Unit ID that is identical to the parent. The system also searches the BLOOD PRODUCT File (#66) for entries in the BLOOD PRODUCT File (#66) that have a PRODUCT CODE Field (#66,.05) defined using the first 6 characters of the parent unit and A0, B0, C0 for characters 7-8 etc. for the total number of aliquots requested. If inadequate entries exist in the BLOOD PRODUCT File (#66) to process the number of aliquots requested, the system displays a warning message.

NOTE: When populating the MODIFY TO field (#66.03,.01) for an ISBT 128 product that CAN be processed into divided units, enter the divided component that indicates the Exxxxx**A0** product code only. Do NOT enter each possible aliquot product created in this field.

The following table illustrates the main differences between dividing a Codabar and an ISBT 128 product type.

Example: Expected outcomes of dividing blood components using Disposition –not transfused [LRBLIDN].

Product Type	Parent Unit ID	Divided Unit ID	Component Name	Product Code
Codabar	04FK54321		AS-1 RED BLOOD CELLS	04210
		04FK54321A	AS-1 DIVIDED RED BLOOD CELLS	Product Code is optional
		04FK54321B	AS-1 DIVIDED RED BLOOD CELLS	Product Code is optional
		04FK54321C	AS-1 DIVIDED RED BLOOD CELLS	Product Code is optional
ISBT 128	W001312345678		ISBT 128 AS-1 RBC	E0291000
		W001312345678	ISBT 128 AS-1 RBC Split A	E02910A0 (Required)
		W001312345678	ISBT 128 AS-1 RBC Split B	E02910B0 (Required)
		W001312345678	ISBT 128 AS-1 RBC Split C	E02910C0 (Required)

Example: Using Disposition -not transfused [LRBLIDN] to create divided units from an ISBT 128 product type.

The following example demonstrates the use of Disposition –not transfused [LRBLIDN] to create two (2) divided units from an ISBT 128 product type. User input is in **bold**. Note that in the screen capture, three (3) aliquots are originally requested, demonstrating the error message that is displayed when inadequate entries exist in the BLOOD PRODUCT File (#66) for the number of aliquots requested.

Three separate entries in the BLOOD PRODUCT File (#66) have been previously defined to create this example. Key field definitions for creating these blood products are detailed in the following table:

Product NAME	Product Code	MODIFY TO:
RED BLOOD CELLS|AS-5/450mL/refr	E0385V00	RED BLOOD CELLS|AS-5 Divided A

PD Pediatric Unit Preparation [LRBLPED]

The option Pediatric unit preparation [LRBLPED] is modified to accept barcode data input from ISBT 128 Unit ID and ISBT 128 product code barcodes. The ability to accept barcode data input from Codabar Unit ID and Codabar product code barcodes, as well as manual data entry, remains unchanged. Changes in the logic used to create pediatric aliquots from an ISBT 128 product type are included.

Highlights of changes observed as a result of installation of patch LR*5.2*267:

Prior to using this option to create pediatric aliquots from an ISBT 128 product, sites must create unique entries in the BLOOD PRODUCT File (#66) equal to the number of aliquots to be prepared. The PRODUCT CODE Field (#66,.05) for these new entries must be defined using the first six (6) characters of the parent unit, then appending A0, B0, C0, etc. for characters 7-8 for each pediatric product created.

The main differences between dividing a Codabar and an ISBT 128 product type are as follows:

Codabar: For each aliquot prepared, the system assigns a Unit ID the same as a parent to which to which it appends the letters PA, PB, PC etc. to identify the specific aliquot. A single entry in the BLOOD PRODUCT File (#66) defining a PEDIATRIC product is required. The word PEDIATRIC must be included in the NAME field (#66,.01) for the pediatric product.

ISBT 128: For each aliquot prepared, the system assigns a unit ID that is identical to the parent. When a pediatric aliquot is created from an ISBT 128 unit, the system searches to see how many previous aliquots have been prepared. The system then searches the BLOOD PRODUCT File (#66) to see if there is an entry with the next logical PRODUCT CODE assigned. The word PEDIATRIC does NOT need to be included in the blood product name. Sites that create both pediatric aliquots and divide units prior to transfusion will use the same Divided product entries as the aliquot units.

NOTE: The Retype After Preparation field in the BLOOD PRODUCT File (#66) must be set to YES for each child product type created.

NOTE: When populating the PEDIATRIC PRODUCT field (#66,.22) for an ISBT 128 product that CAN be processed into pediatric aliquots, enter the divided component that indicates the Exxxxx**A0** product code. Any additional aliquot products must exist, however, they do not need to be associated with the parent component type in order to prepare the pediatric preparations.

The following table illustrates the main differences between creating pediatric aliquots from a Codabar and an ISBT 128 product type.

Example: Expected outcomes of creating pediatric aliquots using the option Pediatric Unit Preparation [LRBLPED].

Product Type	Parent Unit ID	Pediatric Aliquot Unit ID	Component Name	Product Code
Codabar	04FK54321		AS-1 RED BLOOD CELLS	04210
		04FK54321PA	AS-1 PEDIATRIC RED BLOOD CELLS	Product Code is optional
		04FK54321PB	AS-1 PEDIATRIC RED BLOOD CELLS	Product Code is optional
		04FK54321PC	AS-1 PEDIATRIC RED BLOOD CELLS	Product Code is optional
ISBT 128	W001312345678		ISBT 128 AS-1 RBC	E0291000
		W001312345678	ISBT 128 AS-1 RBC Split A	E02910A0 (Required)
		W001312345678	ISBT 128 AS-1 RBC Split B	E02910B0 (Required)
		W001312345678	ISBT 128 AS-1 RBC Split C	E02910C0 (Required)

The following is a screen capture of the option Pediatric Unit Preparation [LRBLPED] using an ISBT 128 product type. This example demonstrates the first pediatric aliquot to be prepared.

Additional Options Modified

Options Modified to Accept Barcode Scanner Input for an ISBT 128 Unit ID Barcode

The following options have been modified to accept barcode scanner input from an ISBT 128 Unit ID barcode label. The ability to accept barcode data input from a Codabar Unit ID barcode as well as manual data entry remains unchanged.

- Unit ABO/Rh confirmation [LRBLIUC] (By individual unit ID)
- Select Units for Patients [LRBLPIC]
- Edit pooled blood product [LRBLJM]

Options Modified to Accept Manual Data Input of a 13 Character ISBT 128 Unit ID

The following options have been modified to accept manual data entry of the longer Unit ID seen with ISBT 128 products.

- Enter blood inventory typing charges [LRBLILS]
- Unit phenotyping [LRBLIUP]
- Edit unit disposition fields [LRBLSED]
- Edit unit log-in [LRBLSEL]
- Edit unit - patient fields [LRBLSEC]
- Free autologous/directed donor units [LRBLSEE]
- Single unit status [LRBLQST]
- Single unit information- display [LRBLIPSD]
- Single unit information- print [LRBLIPSP]
- Special typing charges (inventory) [LRBLRIS] (edit individual unit)

Options and Reports Modified to Print and/or Display the Longer ISBT 128 Unit ID

The following options and reports have been modified to accommodate the longer Unit ID seen with ISBT 128 products:

- Inventory ABO/Rh testing worksheet [LRBLIW]
- Unit ABO/Rh Confirmation [LRBLIUC] (By invoice)
- Blood component requests [LRBLPCS]
- Enter crossmatch results [LRBLPX]
- Unit CAUTION tag labels [LRBLILA]
- Disposition – Relocation [LRBLIDR]
- Blood transfusion results [LRBLPT]
- Shipping invoices for blood components [LRBLISH]
- Units release to stock (cancel) by patient [LRBLIUR]
- Units assigned/components requested [LRBLQPR]
- Print single BB patient report [LRBLP PRINT SINGLE]
- Blood bank consultation reports [LRBLCN]
- CMV Antibody Status Report [LRBLICV]
- Disposition-not transfused [LRBLIDU]
- Units available (indate/no disposition) [LRBLRUA]
- Units with no disposition [LRBLRUN]
- Units on Xmatch by date/time xmatched [LRBLIX]
- Supplier invoices (inventory) [LRBLRIN]
- Special typing charges (inventory) [LRBLRIS] (report)
- Supplier transactions (inventory) [LRBLRIT]
- Phenotyped units available [LRBLIPH]
- Crossmatch/Transfusions by Specialty/Physician [LRBLAA] (detailed)
- Crossmatch:Transfusion report [LRBLRCT]
- Unit issue book entries [LRBLIRB]
- Prolonged transfusion times [LRBLPIT]
- Transfusion data report [LRBLITR]
- Transfusions by treating specialty/physician [LRBLITS]
- Print data change audits [LRBLAD]
- Print units with final disposition [LRBLRUF]
- Patient blood bank record [LRBLQDR]
- Units assigned/components requested [LRBLQPR]

Appendix A - Supplier Multiple Entries for ARC

To properly interpret the UNIT ID for blood components provided by the American Red Cross (ARC), multiple entries should be created in the SUPPLIER multiple to reflect each eye-readable prefix supplied for each blood component provided by your ARC. If your local ARC imports blood from other ARC regions, it may be necessary to enter most or all of the available ARC prefixes. It is recommended that you create these entries now, rather than as needed.

Below is a list of the ARC suppliers and the relevant information for the minimum fields, in addition to COST (required), which should be defined for each ARC entry:

Appendix B - US ISBT 128 Product Codes

This document contains the PRODUCT DESCRIPTION (Name) and the 5-digit ISBT product code of ISBT 128 blood products approved for use in the US as of March 1, 2001. The Product Description and Product Code fields have been extracted from a database provided by the International Council for Commonality in Blood Banking Automation, Inc.

The Product Description field reflects the proper name assigned to the blood component using the ISBT 128 labeling standard. It follows the format of:

Blood Component|Core Condition|Other Attributes|Other Attributes

See Section ISBT 128 BARCODE CHARACTERISTICS FOR U.S. IMPLEMENTATION, heading Structure of ISBT 128 Blood Product Description contained earlier in this ISBT 128 implementation guide for a detailed explanation of the structure of these product description names.

The Product Code field in this table reflects the random 5-digit code assigned to a specific product type. Products that are received from an outside facility will have an additional three digits appended to this code. The sixth character will vary depending upon the type of collection (the default is zero (“0”) and characters 7-8 are usually zero (“0”) when received from an outside collection facility.

This table should be used as a reference when creating new entries in the BLOOD PRODUCT File (#66) for ISBT 128 products that are created as a result modification of an existing ISBT 128 product from inventory or collected by your facility. When creating new entries in the BLOOD PRODUCT File for an ISBT 128 component type, the 5-digit code provided in the table below should be appended with three zeros ("0") at the end.

An example would be:

If your blood supplier provides you with the Fresh Frozen Plasma type
FRESH FROZEN PLASMA|CP2D/XX/<=-18C the product code would be E0713000.

In order to process the frozen unit into a thawed component, an entry in the BLOOD PRODUCT File (#66) should be created for Thawed FRESH FROZEN PLASMA|CP2D/XX/refg. The table below lists the 5-digit code as E0797. In the BLOOD PRODUCT File entry for this thawed component, enter the PRODUCT CODE as E0797000.
