## Photon reconstruction in the Preradiator

## - Goal

Collect all hits produced by a photon with maximum possible separation from other photons.

## - Simulation

1. For each wire, only one hit (first in time) is accounted.
2. $100 \%$ efficiency of the chamber
3. $x$ and $y$ coordinates are known
4. for track search: $x_{\text {hit }} \rightarrow x_{\text {wire }}$

- Clumps in the plane

Hits $i$ and $j$ are in the same clump in plane $k$ if

$$
\begin{gathered}
\left|x^{i, k}-x^{j, k}\right|<1 \mathrm{~cm} \\
x_{\text {hit }}^{i, k} \Rightarrow \tilde{x}_{\text {clump }}^{i, k}
\end{gathered}
$$

(same for $y$-plane)

- Track projection

Clumps $\tilde{x}^{i, k}$ and $\tilde{y}^{j, m}$ are in one track (projection) if

$$
\left|\tilde{x}^{i, k}-\tilde{x}^{j, m}\right|<5 \mathrm{~cm} \text { and } k+1 \leq m \leq k+2
$$

$t_{x}^{k, m}$ means $x$-projection of the track, beginnig at plane $k$ and ending in plane $m$

- Combining $x$ and $y$ projections
$t_{x}^{i, j} \& t_{y}^{k, m}$ if $|i-k| \leq 1$ and $|j-m| \leq 1$ or $t_{x}^{i, j} \& t_{y 1}^{k, l}, t_{y 2}^{m, n}$ if $|i-k| \leq 1,|k-m| \leq 1,|j-n| \leq 1$
- Track direction

For each track, track direction was determing using hits in first 3-4 planes. Track parameters $x, y, z, t_{x}, t_{y}$ corresponds to the starting point of the track.

- Combining tracks into "photon cluster"

Tracks 1 and $2\left(z_{2} . z_{1}\right)$ are in one photon cluster if

$$
\left|x_{2}-x_{1}-t_{x 1}\left(z_{2}-z 1\right)\right|<0.6\left(z_{2}-z_{1}\right)
$$

and

$$
\left|y_{2}-y_{1}-t_{y 1}\left(z_{2}-z 1\right)\right|<0.6\left(z_{2}-z_{1}\right)
$$

## Results

| Particle | Momentum <br> $(\mathrm{MeV} / \mathrm{c})$ | Angle <br> $(\mathrm{mrad})$ | 1 shower | $>1$ showers |
| :---: | ---: | ---: | ---: | ---: |
| $\gamma$ | 50 | 0 | 6866 | 309 |
| $\gamma$ | 100 | 0 | 6947 | 373 |
| $\gamma$ | 100 | 100 | 7001 | 346 |
| $\gamma$ | 100 | 200 | 7490 | 541 |
| $\gamma$ | 100 | 500 | 8316 | 952 |
| $\gamma$ | 250 | 0 | 7163 | 486 |
| $\gamma$ | 500 | 0 | 7295 | 483 |
| $e$ | 100 | 0 | 9499 | 492 |
| $\mu$ | 10000 | 0 | 9981 | 19 |
| $n$ | 200 | 0 | 117 | 432 |
| $n$ | 750 | 0 | 2826 | 1035 |

Table 1: Number of detected showers in preradiator per 10000 incident particles. If the starting point of the second reconstracted track is within the 600 mrad cone of the starting point of the first track, the tracks are in one shower.
