214.67	30.2	1994	214	2000

**Sombero Reef 1994 August-September
No bleaching occurred**

Note: This data, like most weather and other scientific observations, was originally recorded in UTC (Universal Coordinated Time), which used to be known as Greenwich Mean Time (GMT), i.e. the local time at the Greenwich meridian (zero degrees longitude). This allows science observations the world over to have the same time stamp. In order to sort the Sea Surface Temperature (SST) data by each 24 h day Eastern Standard Time (EST, local time for Molassas key) we have converted this data to EST. The Julian dating method counts each day in a calendar year one by one, so Jan.1 of any given year is day 1, Feb. 1 of any given year is day 32. In order to make plotting the hourly SST data easier, we have already converted the hour to a decimal fraction of the 24 h day (i.e. 12 midnight on day 213 is displayed as 213.00, 12 noon on day 213 is displayed at 213.50, etc. Students should only need to use the data in columns A & B to plot this data and draw their conclusions.
