#### INTRODUCTION

This document is intended for use with "Keeping the books for environmental systems: An Emergy Analysis of West Virginia" by Daniel Campbell, Maria Meisch, Tom DeMoss, John Pomponio, and Patricia Bradley published in Environmental Monitoring and Assessment Volume 94: 217-230, 2004 (Campbell et al. 2004). It is described in that article as supporting data and materials residing at <u>http://www.epa.gov/aed/research/desupp3.html</u>.

The references, data sources, and appendices given in this document will be part of a USEPA research report titled "Environmental Accounting Using Emergy: Evaluation of the State of West Virginia" by D.E. Campbell, S.L. Brandt-Williams, and M. E.A. Meisch that will be published later this year (2004). The data, sources, and calculations used to obtain the numbers found in Campbell et al. (2004) are given in the appendices that follow. In the intervening year between completion of Campbell et al. (2004) and the completion of the aforementioned US EPA Research Report errors were corrected and calculations were refined; therefore, some of the numbers in the technical report and on this web site are different from the numbers in Campbell et al. (2004). A list of the major changes follows:

(1) In the calculations in Campbell et al. (2004) a transformity of 196,000 sej/J was used for electricity and 156,000 sej/J for hydroelectricity these values have been replaced using broader averages from Odum (1996) and are now 170,400 for electricity and 120,300 sej/J for hydroelectricity. To obtain these averages adjust the values in Odum (1996) to the 9.26 E+24 sej/y planetary baseline. As a result all numbers that depended on the emergy of electricity used or exported are somewhat different here than in Campbell et al. 2004.

(2) The 1997 emergy to dollar ratio for the United States was recalculated and found to be  $1.20 \times 10^{12}$  sej/\$ rather than  $1.22 \times 10^{12}$  sej/\$. This change was due to the lower transformity of electricity used to estimate nuclear energy's emergy contribution to the emergy resource base for the United States. The transformity of coal electricity was used to estimate the emergy contribution of nuclear electricity. As a result of the change in the emergy to mone y ratio for 1997, all the estimates of emdollar values given in Campbell et al. (2004) must be multiplied by 1.01667 to obtain the numbers in this posting given that no other factor has intervened to cause a change in the emergy estimate for an item.

(3) The geopotenial energy in runoff absorbed in the state was incorrectly calculated in Campbell et al. (2004), because the energy absorbed was determined relative to sea level rather than to the lowest point where the river water leaves the state. When this error was corrected the geopotential emergy absorbed decreased from 18 E+20 sej/y to 16 E+20 sej/y.

(4) The transformity of agricultural products in this posting was determined using a weighted average based on mass. The greater mass of hay lowers the overall transformity from that used in Campbell et al. (2004).

(5)The factor 2:1 used to estimate raw material for the aluminum industry was based on alumina. In fact the estimate should have been 4:1 for bauxite. The correction is made in these tables.

(6) The rule used to estimate imported service was changed. The ratio of the state's per capita income to the national average per capita income was used to estimate the quantity of potentially imported services that would probably be imported when a state's per capita income is less than the national average. As a result our estimate of West Virginia's imported services increased from 4 billion to 6.2 billion dollars.

(7)As a result of the previous changes the emergy to dollar ratio for West Virginia changed very slightly from 5.72 to 5.78 E+12 sej /\$.

(8) Tourism should have been an entry on the exports table rather than the imports table. It is entered this way in the technical report.

(9) Slight changes in the numbers in the summary and indices tables follow as a consequence of these changes.

(10) The conclusions and relationships in Campbell et al. (2004) remain unchanged by the corrections made to the analysis as a result of further examination and criticism over the past year. The above list of changes may not be exhaustive since there are many possibilities for miscalculations and errors in such a large analysis. If any visitor to this site finds an error in or has a question about the information posted here they may contact me at Campbell.dan@epa.gov.

## Appendix A.

## **Primary Symbols of the Energy Systems Language**

Energy circuit A pathway whose flow is proportional to the storage or source upstream.

 $\mathit{Source}\ A$  forcing function or outside source of energy delivering forces according to a program controlled from outside.

*Tank* A compartment or state variable within the system storing a quantity as the balance of inflows and outflows.

*Heat sink* Dispersion of potential energy into heat accompanies all real transformation processes and storages. This energy is no longer usable by the system.

Interaction Interactive intersection of two pathways coupled to produce an outflow in proportion to a function of both; a work gate.

*Consumer* An autocatalyticunit that transforms energy, stores it and feeds it back to improve inflow.

*Producer* Unit that collects and transforms low-quality energy under the control of high quality flows.

Box Miscellaneous symbol to use for whatever unit or function is needed.

Switching Action A symbol that indicates one or more switching actions controlled by a logic program.

Figure A1. Primary symbols of the Energy Systems Language.

## Appendix B.

# Sources, Adjustment, and Calculation of Transformities

B1. Information sources for the emergy per unit values used in this report. The note number links the emergy per unit values listed in this table to the values used in Tables 4-8. The emergy per unit values used in Table B1.1 are given to three significant figures and shown for the 9.44, 9.26 and 15.83 E+24 sej/y baselines. Values are transformities with units of sej/J except where other units are noted. For example where emergy per unit mass is given a (g) for mass is noted next to the item and the units are sej/g. The emergy per unit of education level is sej per individual and the emergy to dollar ratio (sej/\$) is used for services. Table B3.1 gives the factors used to convert one baseline to another. The 9.44 baseline was used by Odum (1996) and revised to the 9.26 baseline by Campbell (2000a). The 9.44 values are reported, because many transformities in the older literature are given relative to this baseline.

Table B1.1 The values and sources for transformities and specific emergies used in this report.					
Note	Item	Source of transformity or	Emergy/unit	Emergy/unit	Emergy/unit
		specific emergy calculation	9.44	9.26	15.83
1	Incident solar radiation	(by definition)	1	1	1
2	Wind -	Odum (1996), p. 309	1496	1470	2.51E+03
3	Earth Cycle	Odum (1996), p. 309	34377	33700	5.76E+04
4	Rain, chemical potential	Odum (1996) Campbell	18200	18100	
		(2003)			3.12E+04
5	Evapotranspiration,	Odum (1996) Campbell	18200	28100	
		(2003)			4.80E+04
6	Rain, geo-potential, land		10488	10300	1.76E+04
7	Rain, geo-potential	Odum (1996) (errata)	27764	27200	
	runoff				4.66E+04
8	Rivers, chemical	Odum (1996), Campbell	48459	50100	
		(2003)			8.13E+04
9	Rivers, geo-potential	Odum (1996), p. 43	27764	27200	4.66E+04
10	Agricultural Products	Brandt-Williams (2001)		63000	
	A weighted average of:	See B3 #7.			
10	Hay (0.86)	See B3 #7.		40100	6.86E+4
10	Grains, fruits, tobacco	See B3 #7.		207600	3.55E+5

**B2. Estimation of Transformities for the SCTG Commodity Classes.** A transformities and specific emergies for each SCTG commodity classes were determined by averaging items within the class for which transformities were known. For classes where no transformities were available the transformity of the raw materials was used as a first order estimate. Transformities for the SCTG commodity class codes are given below as estimated from the transformities of the items listed. See Appendix D Table D1.1 for a definition of the items represented in the SCTG Class Code numbers. Emergy per unit is relative to the 9.26 baseline.

Class	Items in Class Average	Transformity	Spec. Emergy
Code		sej/J	sej/g
1	Avg. poultry and cattle, Odum et al. (1987) Brandt-Williams (2001)	439,300	
	Avg. wheat, grain corn, rice, oats, sorghum, Odum et al. (1987) Brandt-Williams

43	corn and steel for groceries and hardware		6.32 E9

#### **B3.** Calculation of New or Revised Transformities.

In all cases transformity is determined by dividing the emergy (sej or sej/y) required for product or service by the energy (J or J/y) in the product or service.

No. In this section, number simply refers to the new transformity calculations.

1	Calculation of Transformity for Forest C	Frowth in West Virginia
	Evaportranspiration	3.67E+21 sej/y
	Net Timber Growth (includes mortality)	2.10E+17 J/y
		17496 sej/J

### 2 Calculation of Transformity for Forest Net Primary Production in West Virginia

Evaportranspiration	3.67E+21 sej/y
Net Primary Production of Timber	3.09E+17 J/y
	11858 sej/J

3	Calculation of Transformity for Forest Storage in West Virginia		
	Evaportranspiration	3.67E+21 sej/y	
	Average age of a tree	80	
	Forest Storage	1.04E+19 J	
	Emergy to produce the forest	2.94E+23 sej	

#### 4 Calculation of the Transformity of the Elderly in West Virginia

Transformity of biomass in 80 yr-old trees

This estimate was based on the education level that elderly individuals in 1990 attained in 1930. The 1990 census showed that 8.75% of the population was 65-74 years old and that 6.24% of the population was 75 years and older.

28200 sej/J

In 1930, 86% of 14-15 year olds were in school. 20% of 18-20 year olds were also in school. If the average age at graduation was 18 and the same pattern holds, around 20% of the high school age students graduated. In 1940, 4% of 21-41 year olds were enrolled in school. Assuming that these students graduated and that they indicate the average status of those born from 1915 to 1920 about 4% of the 1990 elderly aged 70 to 75 were college graduates.

The educational status of West Virginia in 1990 was estimated as follows: (1) 80% of 65 and older attended school but left between age 15 and age 18. (2) 20% were high school graduates and had some college and 4% were college graduates with some graduate work.

Education Status of Elderly individual	Individuals	Transformity sej/ind.
Total # 65 years or older in 1990	159518	
school (80%)	127615	9.2E+16
college (16%)	25523	2.7E+17
post-college (4%)	6381	1.3E+18
Emergy of all elderly individuals sej	2.69E+22	
Transformity of the elderly in West Virginia.	1.7 E+17 s	ej/ind.

9.26	15.83	1.710	
15.83	9.26	0.585	
15.83	9.44	0.596	

#### Table B3.1 The factors needed to convert one planetary baseline to another.

 Table B3.2 Estimation of the emergy to dollar ratio in the United States for 1997 and 2000

 Data and methods in Odum (1996) pp. 312-315 were used to extrapolate the emergy/\$ ratio.

Year	Fossil fuel use J/y	Transformity	Nuclear J/y	Transformity	Comment	
1997	8.483E+19		7.048E+18		The transformity for electric	2
2000	8.848E+19 :	53000	8.451E+18	157000	was used to estimate nuclea	r contribution.
	Fossil fuel use	Nuclear	Renewable x	Other	Total Emergy GNP \$	Emergy/\$*
	Fossil fuel use E+24 sej/y	Nuclear E+24 sej/y	Renewable x E+24 sej/y	Other E+24 sej/y	Total Emergy GNP \$ Use E+24 sej/y	Emergy/\$* sej/\$
1997		E+24 sej/y			Use	0.

\* These emergy to money ratios are slightly different from the value used in Campbell et al. 2004a, because the earlier numbers were not corrected to the 9.26 baseline.

## **Appendix C**

## Calculation of Energy and Economic Values Used to Determine the 1997 Energy and Emergy Accounts for West Virginia

#### C1 Notes for Table 4 – Annual Renewable Resources and Production in 1997.

The numbers in parentheses and italics refer to data sources given above. The notation E+3 or  $E+3 = 10^3$ .

#### Note

Area 6.2362 E+10 m2 Total land area of the state.

1	Solar Energy	Received	3.074E+20 J/y
		Absorbed	2.644E+20 J/y

Solar energy received (J) = (avg. insolation)(area)(365 day/y)(4186 J/kcal)Solar energy absorbed = (received) (1-albedo)

The average insolation and albedo were obtained from the NASA website (10) referenced in sources. Eleven one-degree lat. by one-degree long. sectors covering the state were averaged.

	kWh/m2/y J/	m2/y	Joules/y
Solar energy received over the state	1369.414	4.93E+09	3.07436E+20
Solar energy absorbed by the state	1177.696	4.24E+09	2.64395E+20

#### 2 Kinetic Energy of Wind Used at the Surface

3.58E+17 J/y

Wind energy =  $(density)(drag coeff.)(geostrophic wind velocity)^{3}(area)(sec/year)$ 

Calculated in Odum (1999) "Evaluating Landscape Use of Wind Kinetic Energy". The wind velocity used was a long-term average of four West Virginia stations in 1993 (11). The common drag coefficient is about 1.0E-3 for ordinary winds of 10 m/s or less over water (Miller 1964). Winds over land are about 0.6 of the wind velocity that the pressure system would generate in the absence of friction and the geostrophic dra

air density	1.3 kg/m3
wind velocity	6.98 mph
wind velocity (metric)	3.12 m/s
Geostrophic wind	5.2 m/s
drag coeff.	1.00E-03
area	6.2362 E+10 m2
sec / year	3.14E+07

#### 3 Earth Cycle Energy

1.39E+17 J/y

Earth cycle energy (steady-	state uplift balanced by erosion) =
(land area)(heat flow/area)	
The heat flow per area is an	n average of nine wells throughout the state.
of West Virginia (12).	
Area	6.2362 E+10 m2

Heat flow/area	70.56 mW/m2
	2.23E+06 J/m2/yr

#### 4 Rain Chemical Potential

3.30E+17 J/y

Chemical potential energy in rain =(area)(rainfall)(density water)(Gibbs Free Energy water relative to seawater)Average annual rainfall based on a one hundred year average from theNational Climatic Data Center (13).Area<math>6.2362 E+10 m2Rainfall1.1 m/yGibbs Energy4.74 J/gDensity1.00E+06 g/m3

#### 5 **Chemical Potential Energy of Evapotranspiration** 1.56E+17 J/y Chemical potential energy in evapotranspiration =

(Area in land use)(Evapotranspiration)(density)(Gibbs Free Energy per gram) Forest Transpiration estimated as 0.85 (Odum et al. (1998) of pan evaporation data measured from 1965 to 1990 at the US Forest Service Station at Fernow, WV (Adams et al. 1993). Direct measurements of evapotranspiration at Fernow in 1998 were used to check the long-term pan evaporation data. *(14)*. Evapotranspiration rates for crops and pasture from Arnold and Williams (1985).

Forest Area	49265769639 m2
Forest Transpiration	5.59E-01 m/y
	1.00E+06 g/m3
	4.74 J/g
	1.30E+17 J/y

### 7 Geopotential of runoff

6.02 E+16 J/y

Geopotential energy of runoff (physical energy of streams) = (area)(mean elevation - (base elevation when > sea level)(runoff)(density)(gravity)The annual runoff is a 30 year average. The elevation was also an average based on known elevations in the selected area (15).

8	<b>River Chemical Potential</b>	Absorbed
---	---------------------------------	----------

2.90E+14 J/y

Received **9.06E+16 J/y** 

River chemical potential energy received = (volume flow)(density)(Gibbs free energy relative to seawater)

River chemical potential energy absorbed = (volume flow)(density) (Gibbs free energy solutes at river entry – Gibbs free energy solutes at river egress)

The Ohio and New Rivers begin and end outside state boundaries delivering part of the chemical potential energy that they carry to the state.

Total Dissolved solids concentration from the USGS data (16). Gibbs Free energy,  $G = RT/w \ln(C2/C1) = [(8.3143 \text{ J/mol/deg})(288 \text{ K})/(18 \text{ g/mol})] * \ln [(1E6 - S)ppm)/965000]$

#### 37 Services

The emergy in imported and exported services was determined using a variation of the base-nonbase method from economic analysis. Data on employment and revenues by NAICS sector for West Virginia and for the United States as whole (31) were used to estimate services exported and imported from the state using a modification of the location quotient and assumption methods. The formulae in the text are evaluated using data from the tables below.

## Table C3.2 Export and Import of Services Between West Virginia and the Nation *Economic Sectors*

<i>Economic Sectors</i>									
Parameters	Agricult	Mining	Utilities	Construct.	Manufact.	Wholesale	Retail trade	Transport.	Informat.
US sector (N <sub>i</sub> )	0.0249	0.0041	0.0057	0.0457	0.1362	0.0467	0.1128	0.0236	0.0247

$(S_i) \div (N_i)$	0.007	0.047	0.011	0.006	0.004	0.004	0.006	0.005	0.004
$(\mathbf{S}_t) \div (\mathbf{N}_t)$	0.006	0.006	0.006	0.006	0.006	0.006	0.006	0.006	0.006
Basic jobs (B)	6075.20	21113.14	3882.36	-4.04	-20546.35	-8239.19	12742.19	-1620.47	-5088.21
Exp(+)  or imp(-)	1.17E+08	5.59E+09	1.63E+09	-6.12E+05	-4.67E+09	-5.77E+09	1.99E+09	-1.77E+08	-1.03E+09
Services in Sector	none	part	part	imports	none	Local (no)	Local (no)	Local (no)	imports
Assumption	Base	Base	Base	nonbase	Base	nonbase	nonbase	nonbase	nonbase
\$ value of goods	all goods	5.03E+09	1.38E+09		all goods				
Services exported <sup>#</sup>	0	5.61E+08	2.48E+08		0				
*									

\*Export is determine by multiplying basic jobs by the \$/employee in the West Virginia sector. Potential import is determined by multiplying the basic job deficit by the \$ per employee in the U.S. sector. Basic sectors can export.

<sup>#</sup> The export sectors summed here are only part service at this level of sector aggregation. Subtracting the dollar value of the goods exported in the sector from total estimated exports gives an estimate of the services exported. An alternative method (Table C3.2) considers higher resolution sector data where the export sectors evaluated are all service.

Table C3.3 Alternative Method for Determining Exports: Detailed Analysis of the Mining and Utilities sectors

#### Table C3.4 Determination of Imported and Exported Services

$\mathbf{D} \leftarrow (1 1 \mathbf{C} \mathbf{I} \mathbf{I})$	
Potential for Importing (\$)	Multiply deficit employment times U.S. worker productivity in sectors assumed
	8.01E+09 to be capable of importing services in Table C3.1 and sum over the sectors.
Fraction of potential (\$)	We assume that states with average per capita income can import the services
imported	deficit and that states below US avg. per capita income can import a fraction of
	the deficit equal to average per capita income of the state /average U.S. per
	capita income. In 1997 this fraction was \$19628/\$25412 or 0.77 for West
	6.17E+09 Virginia. Multiply potential imports by 0.77 to estimate imported services.
Emergy in exported services	Multiply the basic employment in the detailed service sectors above by West
sej/y	Virginia worker productivity and sum. Multiply this dollar amount by the
	7.0E+20 emergy to dollar ratio of the U.S. in 1997 to estimate the emergy exported
Emergy in imported services	Product the imported services times the emergy to dollar ratio of the U.S. in
sej/y	7.4E+21 1997.

# C5. Notes for Table 8 - Value of West Virginia Storages in 1997.

49	Forest Storage	0	1.04E+19 J
	Based on the forest statistics for Wes	t Virginia in the last in	ventory done by the U.S.
	Forest Service in 1989 Digiovanni (1	.990).	
	Forest Standing mass	7.60E+08 tons	

Forest Standing mass

6.89E+14 g 15069.6 J/g

#### 50 Available Coal Reserves

Based on the estimated recoverable coal reserves in 1998 by the West Virginia Bureau of Commerce (34).

mass	53326657317 tons
g/short ton	9.07E+05
J/g	2.94E+04 J/ton

#### 51 Available Petroleum Reserves

#### 1.19E+17 J

1.42E+21 J

Taken from (35) the Energy Information Administration Department of Energy.

Amount	2.10E+07 Barrels
	5.4E+06 Btu/barrel
	1.1E+14 Btu/yr

#### 52 **Available Natural Gas Reserves**

#### 3.13E+18 J

Taken from (5) the Energy Information Administration Department of Energy (1997).

Amount	2.85E+09 1000 ft <sup>3</sup>
J/1000 ft3	1.1E+09

#### 53 People

Using the percentages from the 1990 Census data 1997 Population 1816000

people

#### Number of individuals

	<u>1990</u>	Fraction 1990	<u>1997</u>
Preschool	21680	0.0121	21952
School	1166871	0.6506	1181525
College Grad	379048	0.2113	383808
Post-College	50403	0.0281	51036
Elderly (65+)	157540	0.0878	159518
Public Status <sup>*</sup>	17935	0.0100	18160
Legacy <sup>#</sup>	792		792

<sup>\*</sup>Public Status is estimated as one per cent of total population.

<sup>#</sup>All individuals listed in the index to *West Virginia: A History* by O.K. Rice are counted as part of West Virginia's legacy.

A few of those legacy individuals are:

Henry Davis - West Virginian senator and democratic candidate for the Vice Presidency of the United States in 1904 (lost to Roosevelt and Fairbanks)

Belle Boyd - confederate spy born in Martinsburg, WV

John Brown - known for his actions at Harper's Ferry

Pearl S. Buck - author who won the Nobel prize for literature in 1938, born in Hillsboro

Alexander Campbell, religious leader and educator. Bethany College and the Disciples of Christ. Cornstalk - Shawnee Indian chief

John Davis - constitutional lawyer who argued 140 cases in the Supreme Court, most at the time also the unsuccessful democratic candidate for the US Presidency in 1924 (lost to Coolidge), born in Clarksburg.

Thomas J. "Stonewall" Jackson - confederate general, and exemplary leader.

John Kenna - West Virginian representative and senator, born in St. Albans.

Walter Reuther - president of the United Automobile Workers, born in Wheeling.

Francis Pierpont - governor of the "Restored Government of Virginia" during the Civil War born in Morgantown

Mary Harris "Mother" Jones - leader of strikers in the coal camps who fought for fair labor laws

# C6. Notes for Table 9– Summary Flows for West Virginia in 1997

- 54 Renewable emergy sources received (Table 4) are the chemical potential energy in rain, the energy of the earth cycle, and the chemical potential energy in rivers. Renewable emergy sources absorbed by (used in) the system are the chemical potential energy of rain evapotranspired, the geopotential of runoff doing work on the land, and the chemical potential and geopotential energy of the rivers used as the river flows through the state.
- 55 Nonrenewable sources (Table 5) include fuels and minerals coal, natural gas, petroleum, clay, sand and gravel, limestone and soil erosion where it exceeds soil building, *i.e.*, in agricultural areas.
- 56 Dispersed Rural Source (Table 5) is the soil erosion in agricultural areas. This category includes any renewable resource that is being used more rapidly then it is being replaced.
- 57 Mineral Production (Table 5) is the emergy in the mined tonnage of coal, natural gas, petroleum, clay, limestone, sandstone, sand and gravel.
- 58 Fuels exported without use are the quantities of coal and natural gas exported without first being used in a production process in the state. (coal production + import use = 1522 E+20 sej/y) compared to the commodity flow survey number for coal (1497 E+20 sej/y). Use commodity flow survey number and add 3 E+20 sej/y natural gas exports.
- 59 Imported minerals and fuels are coal, petroleum, iron ore and bauxite (Table 6).

- 60 Minerals used (includes fuels): Add mineral production and mineral imports and subtract fuels exported without use.
- 61 In state minerals used: Subtract minerals exported without use from mineral production.
- 62 The material imported in goods was determined from the 1997 Commodity Flow Survey by summing the tonnage by commodity class from states with significant exports to West Virginia. (see note 36).
- 63 Dollars paid for imports is the sum of the dollar value of imported goods including fuels and minerals and all other goods and services.
- 64 The services in imported minerals including fuels are determined below.

	Amount	<u>\$/amount</u>	<u>\$</u>
Iron Ore (T)	3.0E+06	28.9	1.73E+08
Bauxite (T)	6.7E+05	27	1.8E+07
Coal (sT)	8.704E+06	26.64	2.32E+08
Petroleum (Btu)	2.09E+14		
Petroleum (Barrels)	3.89E+07		
Petroleum (Gal)	1.63E+09	0.799	1.31E+09
		Total	1.73E+09

# **Table C6.1 Services in Imported Minerals**

The prices of these items can be found in the data sources given at (36)

- 65 Dollars paid for goods without fuels and minerals is the total dollar value of goods imported from the CFS ( $$2.5_{E+1}0$ ) minus the dollar value in fuels and minerals calculated above.
- 66 Dollars paid for imported services as determined using the base-nonbase method (Table C3.3).
- 67 Federal transfer payments are the total outlay of funds by the Federal government (note 38).
- 68 Imported Services Total is the sum of the emergy in services associated with imported goods, fuels, and minerals, and pure services.
- 69 Imported Services in fuels and minerals is the emergy equivalent of the human service represented by the money paid for fuels and minerals. Dollars are convert to emergy using the 1997 emergy/\$ ratio for the US.
- 70 Imported Services in Goods is the emergy equivalent of the money paid for goods minus that paid for fuels and minerals. (use 1.2E+12 sej/\$).
- 71 Imported Service is the emergy equivalent of the money paid for services (note 37).
- 72 Emergy purchased by Federal dollars spent in the state. Use West Virginia emergy/\$ ratio.
- 73 Exported Products is the emergy in the goods exported including electricity (Table 7).
- 74 Dollars Received for Exports is the sum of the payments for all exported goods and services
- 75 Dollars Received for Exported Goods other than fuels, is the dollar value of the exported goods (\$2.72E+10) less fuels.
- 76 Dollars Received for fuels and electricity are determined in Table C6.2.

# Table C6.2 Services in Exported Fuels and Electricity

		1997 prices	
	Amount	<u>\$/amount</u>	<u>\$</u>
Coal (Short T)	1.43E+08	26.64	3.8E+09
Natural Gas (tcf)	6.09E+06	3.00	1.8E+07

		Total fuels	3.92E+09
Electricity (kWh)	6.53E+10	0.05 \$/kWh	3.27E+09

- 77 Dollars Paid for Services as determined by the base-non-base method given in (Note 37).
- 78 Dollars spent by tourists in West Virginia from West Virginia Dept. Transportation (32).
- 79 Federal Taxes Paid is the sum of personal income, social security, and business taxes (Note 38).
- 80 Total Exported Services is the sum of the emergy equivalents in human service in fuels, goods and services exported.
- 81 Exported Services in Fuels is the emergy equivalent of the human service in the dollars paid for fuels exported. Service is determined using the US emergy/\$ ratio.
- 82 Exported Services in Goods is the emergy equivalent of the services embodied in all value added exported goods (goods and electricity minus fuels exported without use).
- 83 Exported service is the emergy equivalent of the dollar value of exported services (Note 37).
- 84 Emergy Purchased by Tourists is the emergy purchased when tourists \$ are spent in West Virginia, *i.e.*, at West Virginia's emergy to dollar ratio.
- 85 Emergy Purchases Forgone is the emergy equivalent of taxes paid to the Federal government. This number was determined using the West Virginia Emergy/\$ ratio.
- 86 Gross State Product of the State of West Virginia in 1997.

### C7. Notes for Table 10: Calculation of Emergy Indices.

- 87 Renewable Emergy received (note 54).
- 88 Renewable Emergy Absorbed (note 54).
- 89 In-State Nonrenewable Use is the sum of dispersed rural sources  $(N_0)$  and in-state mineral production  $(N_1)$ .
- 90 Imported Emergy is the sum of imported minerals (F), goods (G), and services (PI).
- 91 Total Emergy Inflow is the sum of renewable emergy received (R<sub>r</sub>), and the emergy imported in the previous note.
- 92 The total emergy used in the state (U) is the sum of the renewable emergy absorbed ( $R_a$ ), the emergy used form dispersed rural sources ( $N_0$ ), fuels and minerals used ( $F_1$ ), and the goods (G) and services (PI) imported.
- 93 Total exported emergy is the sum of the emergy in the materials of exported goods (B), the emergy of services associated with goods and with pure service (PE) and the emergy of fuels and minerals exported without use  $(N_2)$ .
- 94 The emergy used from home sources is the sum of emergy from dispersed rural sources, in-state minerals and fuels used (F<sub>2</sub>), and renewable emergy absorbed divided by total use (U).
- 95 Import minus export is the difference between imported emergy (note 90) and exported emergy (note 93).
- 96 Ratio of exports to imports is the quotient of the expression in note 93 divided by the expression in note 91.
- 97 Fraction of use that is locally renewable is the ration of renewable emergy absorbed to total use.
- 98 Fraction of use that is purchased is the ratio of imported emergy (note 90) to total use (note 92).
- 99 Fraction of use in imported service is PI divided by U.
- 100 Fraction of use that is free is the sum of the renewable emergy absorbed and emergy from dispersed rural sources divided by total use.
- 101 Ratio of purchased to free is the quotient of the sum of imported fuels and minerals ( $F_1$ ), imported goods (G) and imported services (PI) divided by the sum of the renewable emergy received ( $R_r$ ) and the emergy from dispersed rural sources ( $N_0$ ).
- 102 Environmental loading ratio is the quotient of the sum of the emergy from dispersed rural sources ( $N_0$ ), imported fuels and minerals ( $F_1$ ), imported goods (G) and imported services (PI) divided by the renewable emergy received ( $R_r$ ).

- 103 Investment Ratio. There are several possible investment ratios (Odum 1996). This one compares imported emergy (note 90) to the emergy supplied form within the state. The emergy from within the state is the sum of the renewable emergy received ( $R_r$ ), the emergy from dispersed rural sources ( $N_0$ ), and the emergy from in-state fuels and minerals ( $F_2$ ).
- 104 Emergy use per unit area (Empower density) is the total emergy use (U) divided by the area.
- 105 Use per person id the total emergy U divided by the population.
- 106 Renewable carrying capacity at the present standard of living is found by dividing the renewable emergy received by total use and then multiplying this fraction time the present population.
- 107 Developed carrying capacity at the present standard of living is approximately eight times the renewable carrying capacity.
- 108 West Virginia State Economic product (note 86).
- 109 Ratio of West Virginia emergy use to GSP. Divide U by X.
- 110 Ratio of U.S. Emergy use to GNP. See Appendix B3.2.
- 111 Ratio of emergy in electricity use to total use (El/U). See Table 5 for electricity use.
- 112 Ratio of electricity production to total use (Elp/U). ). See Table 5 for electricity production.
- 113 Fuel use per person is the sum of coal, natural gas, and petroleum used in the state (Table 5, 620E+20 sej/y) divided by population.
- 114 Population of the State in 1997
- 115 Area of the State

# Appendix D.

# Calculating Imports and Exports of Materials and Services

#### **D1.** Creating Export/Import Spreadsheets for Materials

The method used to determine the emergy exported from and imported to West Virginia was further developed in this study to take advantage of the extensive data on this subject provided by the U.S. Census Bureau's Commodity Flow Survey (2), which is performed every five years. This innovation resulted in a marked improvement in the accuracy with which imports and to a lesser extent exports to a state's economy can be determined. Even though the CFS provides all the information needed to document exports and imports it is not tabulated in the form that we need and some of the information is hidden rather deeply in the data base. To make our method transparent and reproducible, we have described in detail the characteristics of the database, data sources and methods that we used to determine the emergy imported and exported from West Virginia. These methods should be applicable to the determination of imports and exports for any other state. To facilitate following the method described below the appropriate tables from the CFS should be accessed when needed. If the data tables or presentation of information change in the future these instructions will have to be altered.

#### Export Calculations

Determining material and energy flows for exports is straightforward with few extrapolations or assumptions needed, because the data are relatively complete as provided in the CFS. Data on dollar value and tonnage of export shipments between states by commodity class comes from the Commodity Flow Survey (CFS), Table 12 (Additional State Data). This data is also summarized in Tables 5, 7, and 8 in the CFS. The CFS uses several data codes when a numeric measurement is not given and these codes were handled in a consistent manner. For example, most states have an S or a D in one or more data fields for some commodity shipments. These letters indicate variable data (S) or a single source of information (D) that would risk disclosure. In the export calculation method, no estimate of exports was made for commodity classes with and S or D in both the \$ value and tonnage columns for instate shipments. When this occurs there is often an S or a D in the "all destinations" category, as well. In this case there are too many unknowns to make an estimate. Materials moving in these classes were assumed to remain within the state or to constitute a negligible fraction of exports. Commodities with a dollar value but no information on tonnage were retained in the data because the tonnage could be reasonably estimated using the price per ton obtained from the dollar value and tonnage of the commodity going to all destinations.

Before transferring data from Table 12 to an interim spreadsheet, all dashes (indicating no data) were replaced with zeroes. If there was evidence that some flows were not actually zero, remain uncounted, or are different from the estimates provided, additional information was added when the emergy exported in each commodity class was determined. For example, coal exports were determined using Energy Information Administration (EIA) Data. The Commodity Flow Survey provides a summary table (Table 7) of shipments to all states from the state of origin. Note that the top row in this table gives the total dollar value and tonnage of shipments from the state followed by a set of rows for dollar value and tonnage shipments to each state to which the state of origin is shipping. This includes a row for the state of origin itself, which will be referred to as instate shipments from now on.

An export table (see Table D 1.2) with 11 columns was made to use in determining the tonnage exported in various commodity classes. The commodity classes for SCTG, SIC, and NAICS industry classification codes and the approximate conversions used in this paper are shown in Table D1.1. The column headings for the export table are as follows (1) SCTG code, (2) Description of the class, (3) All Destinations Value(\$ mil), (4) All Destinations Tons(000), (5) \$/Ton, (6) Instate Shipments (\$ mil), (7) Instate Shipments Tons(000), (8) Known (directly measured) exports Tons(000), (9) Instate Tons (000) estimated using \$/T, (10) Estimated exports tons (000), (11) Final Exports (estimated exports are adjusted to sum to the total missing tonnage). . Table D 1.2 omits column 2, the verbal description, because of space considerations.

Class	Combined Code	SCTG code	SIC code	NAICS Code
agricultural products, grain	Α	2,3	1	111
livestock, seafood, animal products	В	1,4	2,9	112

unknown, mixed or special classes	Y	43	92,98,99	99999

Table D1.1. Approximate conversion between SCTG, SIC and NAICS industry classification codes developed for this study. These conversions are only approximate and better information might be developed of used if available.

The steps in estimating exports from a state, e.g., West Virginia, using the data in the spreadsheet columns described above are as follows:

First, copy the Commodity Class code and description from the Commodity Flow Survey Table 12 (Additional Data) for the state, for which exports are to be calculated Columns (1 and 2). Remember in following the instructions below that column numbers refer to the 11 column headings recommended above. The 10 columns shown in Table D 1.2, which is missing column 2, have been numbered to match the verbal description.

1. Copy the \$ value and tons moving from the state to all destinations for all commodities, Columns (3) and (4).

2. Calculate the \$ per ton. Column (5)

3. Copy data (\$ and Tonnage) for shipments of all commodities with final destination in the state of origin, e.g., from WV to WV, Columns (6) and (7).

4 Calculate known exports by subtracting instate shipments (column 7) from the shipments moving to all destinations (column 4) for all commodities for which tonnage has been measured, directly, Column (8).

5. Sum the tonnage of directly measured export shipments (Column 8) and subtract from the total tonnage moving to all destinations. The total tonnage is given at the top of the All Destinations column in Table D 1.2 and in CFS Table 12.

6. Calculate the tonnage of instate shipments for any commodity for which a \$ value of instate shipments is given in column 6 by dividing by the \$ per ton (column 5). Record in Column 9 the estimated instate shipments.

7 Estimate the tonnage exported in these commodity classes by subtracting the instate tonnage estimates (column 9) from tonnage moving to all destinations (column 4). Record these estimates in Column 10. 8. Sum the estimated export shipments (column 9) and divide into the difference between directly measured exports and total exports. If this ration equals 1 combine directly measured and estimated exports in their respective commodity classes into a single column (11) and you are done. If greater or less than 1 multiply each estimated commodity by this ratio to adjust the flows so that directly measured and estimated exports will sum to the known tonnage of total exports shipped to all destinations. Record these numbers in Column (11), Final Adjusted Exports, and fill in column with the directly measured values from Column (8).

	All	All		Instate		Directly	Estimate	Estimate	Final

#### Transferring Export Data to the Emergy Evaluation Spreadsheet

Columns 1, 2 and 11 beginning with SCTG code 1, can now be transferred to the emergy export evaluation section. Do not include commodities with zero flow. These are only shown in Table D 1.2 as placeholders to present a complete listing of all commodity categories.

#### Import Calculations

Table 12 from the CFS web site, "Additional State Data", used in the export calculation, has information on the exports by commodity class going from all the other states to the state of destination (West Virginia). Data from the other 49 states that might be exporting to the study state were combined to determine imports. Inbound shipments by state of origin to the state of destination are summarized in Table 8 of the CFS, but commodity classes are not shown. For states without a U.S. Customs port, state to state commodity shipments will capture almost everything entering the state. When one or more U.S. customs ports are located in a state the foreign imports entering the state need to be added, regardless of whether they are immediately exported to another state. We assume that these imports bring some value to the state by simply passing through.

The inbound tonnage shipped in each commodity category was used to calculate the emergy imported in goods. The five steps used to estimate imported emergy to a state are as follows: (1) a quick tally of the total tonnage coming into the study state from other states was obtained by consulting Table 8 in the CFS report. The states that had a number entered in the percent of total inbound shipments column were identified. The total percentage of imports directly measured was determined by summing the percentages. The total percent of tonnage from the states used to estimate imports should be at least 95% of the tonnage of total inbound shipments. (2) Once the subset of states exporting to the study state was identified, missing values for the tonnage for specific commodities coming from each state were estimated. (3) If a dollar value of the inbound commodity shipments was known and tonnage was not listed, the tonnage was estimated based on the cost per ton as described above and shown in Table D 1.2. A large fraction of total inbound shipments from some states had missing values for both dollar value and tonnage (an S or D entered into the field). In this case, the missing data would have resulted in large errors in the estimate of total imports and thus the development of a method to handle this situation was warranted. The tonnage fields for inbound shipments from a state of origin to West Virginia containing and S or a D were handled by assuming that a state's exports to any other state would on average follow its overall export profile, *i.e.*, the fraction of total shipments accounted for by each commodity. Missing tonnage data was distributed among commodity classes by adjusting the overall export profile. The missing tonnage data is equal to total shipments to West Virginia minus commodities with numeric entries for tonnage. This tonnage was distributed among the commodity classes with inbound shipments by adjusting the state's overall export profile so that the unknown inbound shipments made up 100% of the missing inbound tonnage. (4) The inbound tonnage in each commodity class for a state was transferred as a single column to a second worksheet with data from all of the identified import states. (5) Then each commodity class was summed across the rows for all states to create the column of data with imported tonnages in each commodity class for the emergy table.

- 1. The following steps describe the estimation of the unknown tonnage (S and D) as illustrated for Alabama's shipments to West Virginia shown in Table D 1.3. For all of the states importing to the study state, copy the total tonnage in each commodity class exported to all destinations and the tonnage exported to the state you are evaluating (columns 2 and 3 in Table D 1.3), onto a spreadsheet..
- 2. Calculate the price per ton for all inbound shipments by commodity class from any state exporting to the study state according to the instructions given above for exports.
- 3. Replace all dashes with a zero. Although Table D 1.3 only presents one state, the same procedure will be used for all states sending a significant quantity of imports to the study state.
- 4. Next, missing tonnage values are estimated for any commodity class that reported a dollar value of exports to the state but no tonnage. In some cases calculating the price per ton for the state of origin is not possible, but there is still a dollar value for exports. Prices per ton can be quite variable but find an adjacent state (or use a better estimation method) and substitute this price in the spreadsheet making a note on its origin. Fill in all tonnage movements possible using this method. Combine the tonnages estimated on the basis of average price with the tonnages that were directly measured. Sum this column and subtract from the total tonnage exported to the study state to get the tonnage that will be distributed using the export profile (see the number in italics at the top of column 4 in Table D 1.3). For example, the total export from Alabama to West Virginia is 318 thousand tons but the sum of all commodities determined directly and estimated based on dollar value only adds up to 27 thousand tons, the difference is then 291 thousand tons.
- 5. Create a fourth column for the export profile, which will be used to distribute the missing tonnage across the remaining commodities that had either an S or D in both the dollar value and tonnage fields. The export profile is the fraction of the total tonnage accounted for by each commodity as determined from the shipments to all destinations. Calculate the profile by dividing the tonnage for each commodity exported by the total tonnage exported for that state. Only those

commodities that have an S or D in both dollar value and tonnage fields are recorded in column 4. Sum the fractions to determine the fraction of total tons accounted for by the commodities with missing data.

- 6. The next step is to adjust these fractions to represent the expected fractions of the missing tonnage imported to the state in each commodity class with missing data. Create a fifth column, the adjusted fraction of missing tonnage imported in each class, where each fraction of the tons in the export profile (individual values in column 4) will be divided by the fraction of the total tons that is missing (the sum of all fractions in column four). The sum of all values in column 5 should equal one, or 100%.
- 7. In the last column (column 6), copy over the reported and estimated data for tonnage for any commodity where it is available from column 3. For all of the missing commodities (those with and S or D in both the \$ value and tonnage fields), multiply the total missing tonnage (at the top of Column 4) by the corresponding percentage (in Column 5) for each commodity class known to have a flow but for which tonnage is unknown, and transfer this number to the appropriate field in column 6. For example, if data is missing for textiles, multiply 291 thousand tons by the fraction of textiles or 0.0172, to get 5 thousand tons textiles imported. Sum this column to make sure it adds up to the total tonnage.
- 8. Transfer this tonnage data for each commodity to an import table creating a column for each state.
- 9. Sum across the states (rows) for each commodity to find the total tonnage imported in each commodity class and transfer this to the import section of the emergy evaluation.

# Custom's Imports

If the state has a Customs' port, locate the appropriate data on the USITC data web site (37). The Customs' site requires a password, but registration is free. To get the correct data report, a series of dialogue boxes must be completed. The choices that should be made are as follows:

- Dialogue 1 U.S. General Imports; NAICS code; current US Trade
  - Dialogue 2 Customs value; 1997; All import commodities; All countries; All country subcodes; create new district list
    - Enter the name, select the districts, then highlight the name when you return to original page;

In 1,000,000; annual; NAICS 3 digit; aggregate all countries together; aggregate import programs; display districts separately

- Dialogue 3 Arrange in this order: District; NAICS 3
- Dialogue 4 District; General customs value; Show all; Sort 1997; 5000 records; other display options are optional

Use Table D1.1 or better conversion system to convert from NAICS to SCTG code. Create a column for this data and include it in the summation of imports described in step 9 above.

Description	Total Tons from Alabama (thousands)	Tons to WV (thousands)	Fraction of total tons for missing data	Fraction of missing tonnage to WV	Total Tons to WV (thousands)

## D2. The Method for Calculating Services Imported and Exported

In this study, we adapted the base-nonbase method from economics to estimate the emergy of pure services imported and exported from West Virginia or any other state. This method was first used in an emergy analysis by Odum et al. (1998) and we used that work as a starting point. The theory and formulae for estimating services are given in the methods section above. There follows a detailed description of how we estimated exported and imported services. This material is given so that our method will be transparent and reproducible and therefore easier to refine and improve.

To determine exported and imported services, go to the NAICS economic sector data U.S. data (31) and then choose the state from the menu in the upper left-hand corner. You will also need agricultural and government data not given in (31). Government expenditures by state are available in the U.S. Statistical Abstract for 1997 (also online). Agricultural data can be obtained from Economic Research Service, USDA Data- Farm and Farm-Related Employment (38). These instructions create one large table comparing all of this data, but if smaller pieces are preferred, use a method that makes sense as long as the basic guidelines are preserved.

- A) Using the list of non-farm industries given by NAICS two digit industry codes and recorded on the U.S. Census Bureau web site, there are 18 industry sectors (Table D 2.1), to which agriculture and government should be added. This table will be used to classify each sector as base or nonbase. As mentioned in the services section of the main paper, base sectors are those that will have enough production to export, while non-base sectors are more likely to serve the local (state) economy. Agriculture, manufacturing, mining, and state and federal government are sectors that are often considered to be basic sectors. In the case of West Virginia, the utilities industry was added because it exports a large fraction of the electricity produced. Non-basic industries provide mostly local services such as support services and the retail industries like grocery stores, dry cleaners, drug stores etc. The data for each state should be examined and each of the 20 industry sectors designated as basic or non-basic industries using a set of initial assumptions. Since this method is only used to determine services imported and exported, each industry category must be further considered from this point of view. For example, in West Virginia exports from the manufacturing and agriculture sectors are almost entirely goods (this can be verified by examining the more detailed listing of higher digit industry sectors in the U.S. Census Bureau listing by NAICS code, see web site given above), the service component of which is determined below. In addition the mining and utilities sectors also are largely goods exporting sectors, however, each of these sectors has a service component. To accurately estimate the exports from these two sectors the detailed level of NAICS industry categories was used. This information is available at the same web address (31). For example, within the mining sector there is a category for mining support activities. For West Virginia this category includes classes for drilling oil and gas wells, support activities for oil and gas operations and support activities for coal mining. All three of these are sources of potentially exportable services. The detailed code data should be used when it is needed for the particular economic situation in a given state. However, the two digit data can be used where the entire sector provides services for export or that might be imported. Table 1 gives a list of the 20 two digit industry categories and the assumptions that were made about them for West Virginia.
- B) In the second table, the 20 sectors become the column headings and the data and calculations using this data are the rows. Table D 2.2 presents an abbreviated version of the total table (See Appendix C for the complete West Virginia table). The following steps are the same for calculating values for all columns, or sectors, and match the note numbers in Table D 2.2; however, you might want to complete rows 15 and 16 first. An explanation of the rows in Table D 2.2 follows:
  - 1) U.S Paid employees. This number is from either the U.S. census table or one of the other two sites listed above for agriculture and government.

- 2) U.S. Sales, Receipts or Shipments (\$1000). This number is from either the U.S. census table or one of the other two sites listed for agriculture and government.
- 3) U.S. Dollars per employee. Divide row 2 by row 1 and multiply by 1000.
- 4) U.S. Fraction of Total Employment. Divide row 1 by the value for line 15 (see note 15).
- 5) State Paid employees. This number is from either the WV census or from one of the other two sites listed above for agriculture and government.
- 6) State Sales, Receipts or Shipments (\$1000). This number is from either the WV census or from one of the other two sites listed above for agriculture and government

Industry	Sector Type	Notes
Agriculture	Basic-export	all goods
Mining	Basic-export	Support activities (only)
Utilities	Basic-export	Electric services (only)
Construction	Nonbasic	Local markets
Manufacturing	Basic	All goods
Wholesale trade	Nonbasic	Local markets
Retail trade	Nonbasic	Local markets (no export)
Transportation & Warehousing	Nonbasic	Local markets
Information	Nonbasic	Potentially imported
Finance &Insurance	Nonbasic	Potentially imported
Real estate & rental	Non-basic	Local markets
Professional, scientific services	Non-basic	Potentially imported
Management of companies	Non-basic	Potentially imported
Administrative support & waste management	Non-basic	Potentially imported
Educational services	Non-basic	Potentially imported
Health care and social assistance	Non-basic	Local markets (no export)
Arts, entertainment & recreation	Non-basic	Potentially imported
Accommodation and food service	Basic	not imported or exported
Other services (not public)	Nonbasic	Local markets
Auxiliaries	Non-basic	Local markets
Government	Basic	not exported

1	U.S Paid employees	509006	5664840
2	U.S. Sales, Receipts or Shipments (\$1000)	173988778	858581046
3	U.S. Dollars per employee	341820.68	151563.16
4	U.S. Fraction of Total Employment	0.004094585	0.04556954
5	State Paid employees	23927	31312
6	State Sales, Receipts or Shipments (\$1000)	6333463	3106093
7	State Dollars per employee	264699.42	99198.17
8	State Fraction of Total Employment	0.034013838	0.04451211
9	Location Quotient	8.31	0.98
10	Sector ratio of regional to national employment	0.05	0.01
11	National ratio of regional to national employment	0.01	0.01
12	Basic sector jobs	2.10E+04	-7.44E+02
13	Potential state services export/import	5.57E+09	-7.38E+07
14	State services export (+) or import (-)	1.02E+08	-3.69E+07

Table D2.2. Calculation of basic sector jobs and the estimated dollar values for exported and imported services.

15 Total U.S. employment, all sectors plus agriculture and government	124311992
16 Total WV employment, all sectors plus agriculture and government	703449

Estimation of services actually exported using data for the entire mining sector. 14' More detailed sector data that separates out service components may also be used

Total non-service mining receipts, WV	6,021,285,000
Total non-service mining employment, WV	20983
Total non-service mining employment, US	340200
Fraction total employment, WV	0.0298
Fraction total employment, US	0.00274
Location quotient	10.90
Non-service \$/employee, WV	286,960
Sector ratio of regional to national employment	0.0617
National ratio of regional to national employment	0.00566
Basic sector jobs	19058
Material export	5,468,857,228

- 7) State Dollars per employee. Divide row 6 by row 5 and multiply by 1000.
- 8) State Fraction of Total Employment. Divide row 5 by line 16 (see note 16).
- Location Quotient. Divide row 8 by row 4. If this number is >1 the state is able to export a portion of this sector's productivity.
- 10) Sector ratio of regional to national employment. Divide row 5 by row 1.
- 11) Ratio of regional to national employment. Divide row 16 by row 15. This is a constant across all sectors and is an indication of the overall available workforce, regional to national.
- 12) Basic sector jobs. The number of basic jobs in a sector is found by subtracting the fraction of national employment in the region from the fraction of regional sector employment in the national sector, and then multiplying by national employment in the sector. Subtract row 11 from row 10 and multiply the difference by row 1. A positive number indicates an exporting sector and a negative number indicates a potential importing sector. However, the original assumptions about sector behavior will determine whether the potential for export or import is realized.
- 13) Exported goods and services are determined by multiplying the regional sector productivity per worker by the number of workers in the basic part of the sector. In other words, multiply row 12 by row 7 unless the initial assumptions about this sector make it a non-basic or non-exporting sector. Potential imports are determined by multiplying the national sector productivity per worker by the deficit number of workers for the sectors importing services. Multiply a negative value in Row 12 by the value in row 3.
- 14) Exports are corrected by subtracting the services in exported goods from the potential exports of a sector. For West Virginia this was done for two sectors - mining and utilities. Other basic sectors were shown to either not export or to export only goods. The dollar value of goods exported from the sector must be subtracted form the total exports obtained in 13 to get an estimate of the services exported. For example, the dollar value of electricity exported could be subtracted from the utility sector exports estimated in 13 to get an estimate of the value of electrical services exported. We also estimated services exported by an alternative method. To use this method, step down one level of information into the structure of the exporting sector. Detailed information for these sectors is available (click on the arrow next to the sector in the main tables). Using this data, complete the same procedure used above for the pure service components of the sector to determine services exported directly. These estimates are totaled and constitute the estimate for exported services when summed over all basic sectors that export. The emergy in the goods exported could also be determined by performing the location quotient analysis on the sub-sectors that are exporting goods. The sum of these export estimates can then be subtracted from the total in 13 to give a remainder that is the estimate of exported services. To estimate the actual imports, we assumed that a fraction of the potential import (a negative amount on line 13) equal to the ratio of West Virginia's per capita income to national per capita income is actually imported into the state as explained above. Sum the positive values for exported services and the negative values for imported services, respectively. These totals are transferred to the import/export tables in the emergy evaluation for total services
- 15) For 1997 studies of U.S. states, the number provided here can be used for the national totals. It is the total employment for all sectors including agriculture and government.
- 16) West Virginia total employment in 1997 is the sum of employment in all sectors mentioned above.
