National Agricultural Statistics Service

ACKNOWLEDGMENT

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida as shown in this summary and corresponding data for other citrus states are official estimates of the USDA, National Agricultural Statistics Service. Chilled and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetables, Florida Department of Agriculture and Consumer Services, were used in preparing production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, processors, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

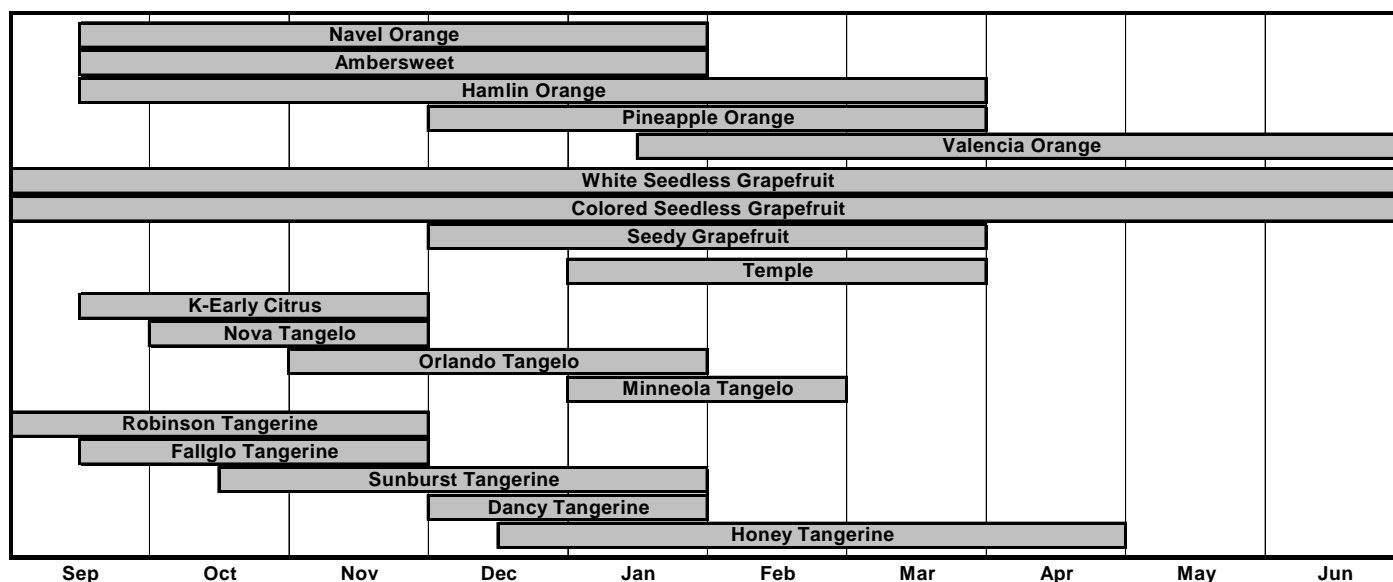

This report was assembled under the direction of Jeffrey K. Geuder, Robert R. Terry, William C. Curtis, Candice T. Erick, and Rhonda L. Johnson of the USDA/NASS/Florida Field Office.

FLORIDA CITRUS HARVESTING SEASON

TREE CENSUS

The Florida Agricultural Statistics Service first indexed the State's commercial citrus groves on aerial photography in January 1966. Ground crews update the information by identifying all the State's groves by fruit type, row spacing, and year in which set. Photo interpreters in the Orlando office then delineate the groves by variety blocks on photo transparencies at a scale of 1 inch to 660 feet. Variety blocks are measured with planimeters to obtain acreage and then indexed by land section.

The design of the inventory survey allows for quick and economical updating. Since 1966, the citrus belt has been re-surveyed each second winter to determine changes. Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile-wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography are obtained at a 1 to 30,000 scale.

The last complete statewide survey was conducted as of January 2004. Florida's citrus acreage, declining for most of the past decade, totaled 748,555 acres. In response to the need for more accurate citrus tree numbers following the hurricanes of 2004, a special census in DeSoto, Hardee, Indian River, Martin, Palm Beach, and St. Lucie was conducted during the first six months of 2005. Acreage losses vary from 1,486 (Palm Beach) to 18,560 (St. Lucie). Comparisons in the six counties between 2004 and 2005 shows that decreases in acreage by fruit category are as follows: Oranges are down 10.7%, grapefruit 18.5%, specialty fruit 16.4%, and all citrus 12.7%. It is important to note that losses are not due solely to hurricane damage, but also reflect effects of the citrus tristeza virus, urban development, and removals due to citrus canker through June 2005.

COUNTY PRODUCTION

Estimates of citrus production by counties were prepared using objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for droppage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Productivity per tree is obtained from several objective fruit surveys including limb count, size, and droppage. Because of the statistical sampling design, counties with higher production in general have a greater number of samples and, therefore, estimates for these

counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are more reliable than for the individual counties.

FLORIDA CITRUS: Acres in commercial groves, as of January 1976-2004

Census Year	Acres	Percent change from	
		Previous survey	1966 survey
1976	852,369	-1.4	-0.7
1978	831,235	-2.5	-3.1
1980	845,283	+1.7	-1.5
1982	847,856	+0.3	-1.2
1984	761,365	-10.2	-11.3

2004-05 SEASON HIGHLIGHTS

PRODUCTION

U.S. citrus utilized production for the 2004-05 season totaled 11.4 million tons, 31 percent below the 2003-04 season and 36 percent lower than the record high production of 17.8 million tons for the 1997-98 season. Florida accounted for 67 percent of total U.S. citrus production. California totaled 29 percent, while Texas and Arizona produced the remaining 4 percent.

Production of **Florida** citrus in 2004-05 was 169.1 million boxes, down 42 percent from the 291.8 million boxes in the 2003-04 season. The primary reason for the reduced crop was the unprecedented three hurricanes and one tropical storm that passed through the state in August and September 2004. Production was lower for all varieties except tangelos. The orange crop production, at 149.6 million boxes, was the lowest since the 139.8 million boxes in 1991-92. Early-midseason-Navel production was down 37 percent and Valencia orange production was down 39 percent. Navel production, at 2.5 million boxes, was the lowest since the 1986-87 season. Navels, primarily a fresh use crop, comprised 46 percent of the total early-midseason-Navel fresh shipments. All grapefruit production at 12.8 million boxes was the lowest since 1935-36.

In response to the need for more accurate citrus tree numbers following the hurricanes of 2004, a special census in selected counties was conducted during the first six months of 2005. Two counties, DeSoto and Hardee, are in the Western growing area and were subjected to strong winds from Hurricane Charley. The other four counties: Indian River, Martin, Palm Beach, and St. Lucie, are along the Atlantic coast, and bore the brunt of Hurricanes Frances and Jeanne.

Acreage losses varied from 1,486 (Palm Beach) to 18,560 (St. Lucie). Hardee's acreage peaked in 2002, while DeSoto's high was in 2000. Acreages in Indian River, Martin, and St. Lucie have been trending downward since 1994, and Palm Beach acreage has been declining since 1970. Decreases in acreage in the special counties were larger than corresponding decreases in tree numbers, with acres of oranges down 11 percent, grapefruit down 19 percent, specialty fruit down 17 percent, and all citrus down 13 percent. Florida's total bearing acreage, at 641,400 acres, is the lowest since the 1993-94 season.

California increased utilized citrus production by 16 percent from the 2003-04 season. California's all orange production, at 61.0 million boxes, was 21 percent higher than the previous season. Grapefruit production, at 5.8 million boxes, was unchanged from the 2003-04 season. Utilized production of citrus in Texas was up 14 percent from the 2003-04 season. Orange production increased 7 percent from the previous season and grapefruit production was up 16 percent. Arizona's total citrus production was down 22 percent

from last season. Grapefruit utilized production was unchanged, while oranges and lemons were down 9 and 20 percent, respectively, from the 2003-04 season.

VALUE

The value of the 2004-05 U.S. citrus crop was down 4 percent from last season to \$2.39 billion (packinghouse-door equivalent). Total value of production for 2004-05 was lower for all types of citrus, except grapefruit, lemons, and tangerines. Orange value of production decreased 16 percent from last season, while grapefruit value increased 25 percent. Tangerine value of production increased 13 percent from last season. Lemon value of production increased 30 percent. Tangelo and temple values were down 20 percent and 33 percent, respectively, from the previous season.

The \$742.2 million preliminary value of the **Florida** 2004-05 citrus crop, the lowest since 1985-86, was down 17 percent from the 2003-04 season's revised value of \$891.5 million. On-tree values were lower for all orange varieties and tangelos but higher for grapefruit, Temples, and tangerines. Price-per-box was higher for all varieties except tangelos, with grapefruit's being the highest on record for both white and colored varieties. Normally, more grapefruit goes to processing rather than being shipped fresh; however, due to the season's reduced crop, slightly more grapefruit went fresh than processed.

FOREIGN EXPORTS

Fresh fruit exports totaled 9.9 million ⁴/₅-bushel cartons. Japan accounted for the majority Florida grapefruit. Canada received the most of Florida orange and specialty fruit exports. More details are listed on page 39.

FROZEN CONCENTRATE

A total of 9.9 million gallons of FCOJ, and 4.1 million gallons of FCGJ were exported this year. FCOJ exports equaled half as much as last year, and FCGJ exports were just over one-third as much as last year.

The final FCOJ yield, reported by the Florida Citrus Processors Association, was higher this season for all oranges (1.58311), higher for early-midseason fruit (1.52920), and lower for late oranges (1.67671). The final tangerine yield (FCTJ) was lower (1.46230) and the grapefruit yield (FCGJ) was up (1.23938).

Prices for fruit going to concentrate was higher for all varieties (includes price per box, and price per pound solid).

FLORIDA CITRUS: Value of sales on-tree, crop years 1995-96 through 2004-05

Crop year	Value	Crop year	Value
	<i>1,000 dollars</i>		<i>1,000 dollars</i>
1995-96	1,075,817	2000-01	862,031
1996-97	960,496	2001-02	966,803
1997-98	1,023,383	2002-03	787,378
1998-99	1,097,253	2003-04 ^{1/2/}	891,500

PRICING FLORIDA CITRUS

PRICES

All prices reported in this publication, except the concentrate prices in the table on page one, are on-tree prices representing the average price received by growers for their fruit. The term "on-tree" relates to fruit returns to the grower after the costs of picking, hauling, and packing have been removed. Prices are based on records of commercial fresh fruit sales and processed fruit returns.

Each season, beginning with the first month that at least three percent of a fruit type is harvested, monthly estimates are computed. Reports from fresh fruit sales organizations and from packers provide data for an average freight-on board (f.o.b.) price. Processors report an average spot and cash price for fruit delivered to their plants. From these values, an estimated charge for picking, University of Florida economists, are deducted to arrive at the final on-tree price received by growers. These preliminary figures for the season just ended, the revised figures for the previous season, and county production by type are released annually in late September.

PACKOUT RATES

Fresh prices shown in this publication are for "pure fresh" or 100% packout. Grading diverts a portion of the crop from fresh use. Returns at processing plants for this diverted fruit will generally be less than for field run fruit because of extra costs. In order to compare fresh prices shown in this publication to the

hauling, and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales.

At the season's end, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price. A year later, after most processed products are sold, cooperatives and firms with participation plans report prices of fruit they handled. These prices, combined with the spot and cash prices collected earlier, are weighted together by varieties to determine the final processing price received by growers. From this price, charges for picking, hauling, and packing, as estimated by

individual grower's return it is necessary to calculate a derived price for that crop. Below is an example and a blank table for calculating fresh returns based on packout rates.

The example describes a delivery of 1,000 boxes with a packout rate of 60% (0.60 in decimal format). At this rate, 600 boxes (1,000 X 0.60) are shipped fresh at a price of \$9.50 per 1 3/5 bushel box equivalent. The remaining 400 boxes (1,000 X 0.40) are eliminations hauled to a processing facility and receive a price of \$1.20. The grower receives \$5,700.00 for the fresh portion and \$480.00 for the processed portion. Dividing the total amount of \$6,180.00 by the total of 1,000 boxes results in a derived price of \$6.18 per box.

SAMPLE CALCULATION OF GROWER'S RETURN

	Packout Rate		Prorated Boxes	On-tree Price	Amount Received	Derived Price
	Percent	Decimal				
Shipped Fresh	60	0.60	600	X Fresh \$9.50 =	\$5,700.00	
Eliminations	40	0.40	400	X Processed \$1.20 =	\$480.00	
Delivered to Packinghouse	100	1.00	1000		\$6,180.00	\$6.18

CALCULATE YOUR RETURN

	Percent	Decimal				
Shipped Fresh				X Fresh =		
Eliminations				X Processed =		
Delivered to Packinghouse						

2004-05 FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS, AND MONTHS

Conditions for **January** 2004 were typical of Florida winter weather. Temperatures were in the mid 30s at night with daytime highs in the 60s and 70s. Some growers irrigated to maintain good tree condition and to encourage crop growth. **February** had a wide range of temperatures from as low as the mid 30s at night to the 80s on some days. Groves and trees were in good condition for the bloom period. Some coastal areas received over five inches of rain, while interior areas received about two inches. In early **March**, field workers reported feathery new growth and abundant bloom buds on oranges and grapefruit. Lower interior trees were in full bloom by the first of the month. Cultural practices included fertilization and hedging following harvest. Daytime highs reached to the mid 80s on many days. **April** was cool and dry. Owners with well cared for groves continued irrigating to maintain healthy trees to hold the next season's abundant crop. By the middle of the month, bloom was complete in all areas. Dry and warm weather throughout **May** forced growers to continue irrigation. Most trees remained in good condition, while some young trees produced a lot of new growth.

June welcomed rain in much needed areas. Temperatures reached the lower to mid 90's on many days before afternoon storms arrived. The summer flush of new growth appeared on younger trees and new crop fruit was progressing well with good sizes being reported. In **July**, heavy thunderstorms with severe lightening brought rains and high winds. Some west coast stations recorded over nine inches for the month while other areas reported only minimal amounts all month. The month of **August** was marked by hot temperatures and high humidity. On August 13, Hurricane Charley entered the state in Charlotte County and moved northeast through DeSoto, Hardee, and Polk counties. After moving through Orange and Seminole counties, it exited the state near Daytona Beach. Varying amounts of fruit dropped to the ground and tree limb breakage was prevalent. Growers and caretakers continued routine summer cultural practices including weed control, insect spraying and dead tree removal and replacement.

In **September** one major storm and two more hurricanes crossed the state. Downgraded tropical storm Ivan went from east to west bringing heavy rainfall. Hurricane Frances entered the state near Stuart early on the 5th and exited north of Tampa late that night. Then on September 26, exactly three weeks later, Hurricane Jeanne entered the state at the same location and followed nearly the same path. Heavy amounts of fruit droppage and widespread tree limb breakage were observed from both storms. Hurricane Jeanne was so large it affected all but three citrus producing counties in the state (Hendry, Collier, and Lee counties).

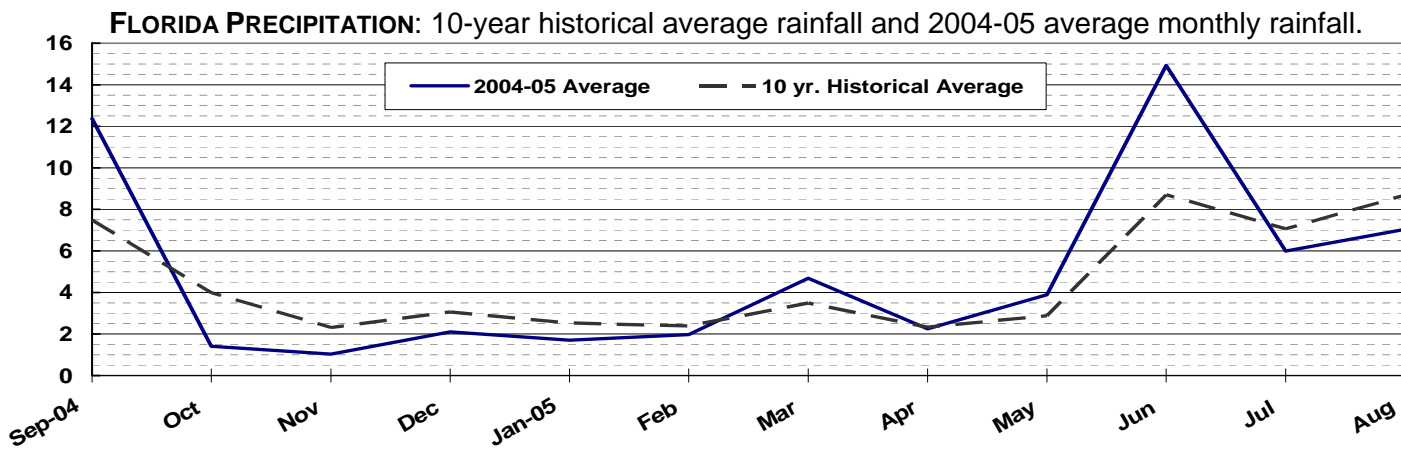

Florida's weather patterns returned closer to normal in **October**. Temperatures were above average with the exception of one

cool front that moved through the state near the beginning of the month. **November** temperatures were mostly at or above average all month. Rainfall was at or below average, with limited showers ahead of the cool fronts. Lakes and canal levels remained high. Growers continued with clean-up operations in hurricane-affected areas. Many trees continued to look battered but had grown new foliage. **December** was mostly dry. On several mornings, temperatures reached the low 30's in some northern and central locations. Growers conducted typical winter cultural practices including weed and cover crop control, dead tree removal and replacement, and hedging. **January** had several mornings with temperatures in the mid to low 30's to the mid 40's. Slight frost was reported on one morning, with no significant damage.

February was beneficial with cool nighttime temperatures and moderate to warm days. Some coastal areas received over five inches of rain while interior areas generally had about two inches. Citrus trees remained in good to excellent condition in spite of the recent relatively dry weather. Some early orange varieties showed slight amounts of open bloom, while later blooming varieties showed buds just forming. **March** brought slightly higher amounts of rainfall than normal with cool nighttime temperatures and moderate to warm days. **April** was mostly warm and moderate for the month with some windier days during the third week. Daytime highs reached the mid 80s in all areas. Some of the new pea size fruit dropped as the trees adjusted to the size or quantity they could carry for the next crop year.

May's weather varied with mostly moderate temperatures, and dry conditions. Late in the month a low pressure system moved across the state bringing rainfall. This pattern extended into the first of **June**. Groves and trees were in good condition with golf ball size fruit on oranges for the next season, and slightly larger sizes on grapefruit. Rainfall during **July** was about average. Trees in well cared for groves were reported in good condition and showed a good summer flush of new growth. New crop fruit progressed well with less than average sizes and heavy fruit sets being reported as the citrus industry began to get ready for a new crop year.

In the chart below, the 2004-05 monthly rainfall is compared to the 10-year historical average which includes data from two stations in each of the five citrus producing areas. The ten stations are: Avon Park (2 W), Arcadia, Clermont (7 S), Immokalee (3 NNW), Labelle, Orlando (WSO McCoy), Plant City, Stuart (1 N), Vero Beach (4 W), and Winter Haven.

HISTORY OF FLORIDA'S CITRUS INDUSTRY

The citrus tree is a native of the Orient. From there it was carried ever westward by man, to India, to the Mediterranean, and across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Hispaniola. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that then citrus fruits were grown in abundance around St. Augustine.

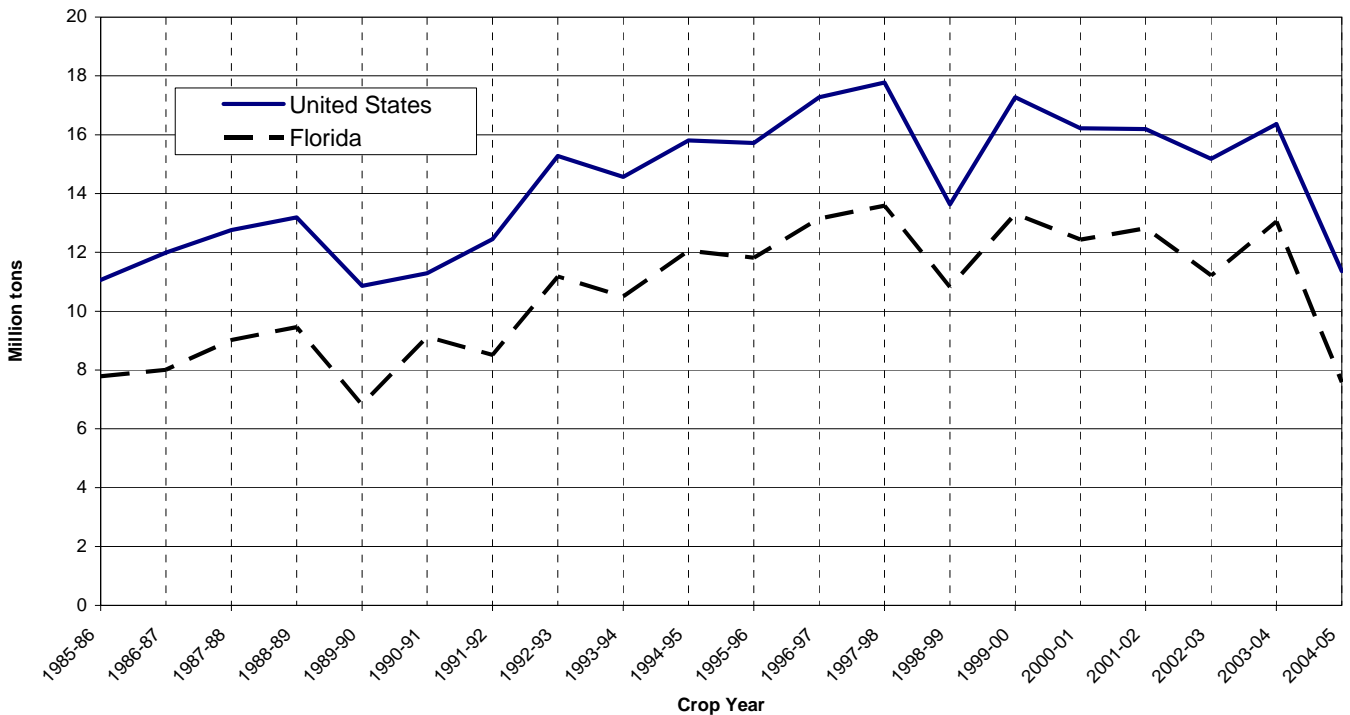

Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest cultivated groves planted in Florida (Hume, 1926, p. 95) is thought to have been the Don Phillipe grove in Pinellas County, planted sometime between the years of 1809 and 1820. Nearly 1.5 million boxes were shipped in 1887-88, the first season on record. Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. The highest production ever was reached in the 1997-1998 season, when Florida produced 304.5 million boxes.

^{1/} Includes tangelos and Temples. K-Early Citrus Fruit included through 2001-02.

^{2/} 42.0 degrees Brix.

^{3/} Prior to 1996-97, canned and blended juice only. Since 1996-97 includes sections and salads, canned, fresh squeezed, and blends.

^{4/} Freeze year.

^{5/} 40.0 degrees Brix.

^{6/} Used primarily in FCOJ.

Post Hurricane Update –Selected Counties

In response to the need for more accurate citrus tree numbers following the hurricanes of 2004, a special census in selected counties was conducted during the first six months of 2005. Two counties, DeSoto and Hardee, are in the Western growing area and were subjected to strong winds from Hurricane Charley. The other four counties: Indian River, Martin, Palm Beach, and St. Lucie, are along the Atlantic coast, and bore the brunt of Hurricanes Frances and Jeanne.

Field personnel updated records by conducting field enumeration, visiting grove managers, and consulting with the Division of Plant Industry's Citrus Canker Eradication Program. It is important to note that tree losses are not due solely to hurricane damage, but also reflect effects of the citrus tristeza virus, urban development, and removals due to citrus canker through June 2005.

BOXES OF FRUIT PER TREE

The Florida Agricultural Statistics Service conducts objective surveys to determine fruit per tree, average sizes, and droppage between August and maturity. These data are used to estimate production per tree for each type of citrus fruit, as shown in the following four tables.

The estimates of production per tree are based on official end-of-season production estimates and the number of bearing trees indicated by the citrus tree inventory surveys. The averages

of boxes per tree for age groups shown are calculated from estimates of fruit per tree in August, size at maturity, and drop between August and maturity.

Additionally, the boxes are subdivided by production areas. Estimated boxes by types and age groups are weighted averages of the indicated seasons. Small sample sizes in some age/area cells and rounding may contribute to inconsistent averages.

FLORIDA CITRUS: Estimated boxes of fruit per tree by age groups and production areas, 2000-01 through 2004-05

^{1/} Forecast.

^{2/} Crop years refers to harvest and marketing period, which usually begins in the fall and extends to the spring.

^{3/} One metric ton is equivalent to 2,204.6 pounds.

^{4/} Includes Temples.

^{5/} Includes small quantities of tangerines.

^{6/} Mainly Satsumas, but also including mandarin hybrids.

^{7/} Clementines only.

^{8/} Includes tangelos, which account for about half of the combined tangerine and tangelo production.

^{9/} Israel, Cyprus, Morocco, and Japan.
