## General Summary

The industry forecasts a production increase for apples, apple juice and pears in MY2002 (Jan-Dec 2003) in spite of unfavorable weather. Table grape production, total output is forecasted to stay at similar levels to year.

Apple and pear exports are also forecasted to rise in response to the increase in production. No major changes in exports of apple juice and grapes are expected.

## Fresh Apples

## Production

Chile's total apple production for Marketing Year (MY) 2001 (Jan-Dec 2002) were similar to the previous year. Crop quality was reportedly lower, nevertheless exports expanded due to a strong export demand, mainly from Latin American countries which regularly accepts lower quality apples. Although it is still early to predict the effect of bad weather this spring season on production volume and quality, industry officials have indicated that they expect an overall larger output of average quality for MY2002 (Jan-Dec 2003).

Producers continue to diversify their orchards by planting new and more popular varieties, i.e., Fuji, Gala, Jonathan, Braeburn, Pink Lady and Galaxies. Traditional varieties, such as Red Delicious and its variations, i.e., Richard Red, Starking, etc., are being uprooted and replanted with these newer varieties. Red apple varieties still constitute about 70 percent of total output and are grown mainly for the European and the Middle Eastern markets. The principal green variety, Granny Smith, is used both for fresh export (mainly Europe and the United States) as well as for concentrated apple juice production.

## Crop Area

Although some growers, mainly in Regions VII (Curico-Talca) and VIII (Chillan), continue to replace and increase their planting densities other areas are uprooting old orchards. As a result total planted area has leveled off, according to the Fresh Fruit Producers Association. Low prices over the past few years have also forced many marginal producers to uproot their orchards.

## Consumption

Since there are no official domestic consumption statistics for apples, figures are estimated as a residual of production and exports. Because the residual figure includes apples for fresh domestic consumption and for processing, there is an apparent large variation in domestic fresh consumption in the PS\&D tables from year to year.

## Trade

For MY2001, the latest forecast is for a significant increase in exports when compared to both, our previous estimates and last years exports. Strong demand, due to lower stocks at the end of the season in Europe together with increased demand for lower quality apples in Latin American markets explains, the significant increase in exports during this period. The U.S. is Chile's largest single export market for apples, up from 6 percent in 1997 to 12 percent in 2002.

Red apple varieties account for about two-thirds of exports, but sweet/sour varieties are increasing their share. Chile's traditional varieties are losing ground. This trend is becoming more evident every year. Production and exports of new
varieties, like Fuji, are increasing significantly.

Trade statistics show no imports of apples during CY2002. The devaluation of the Chilean peso and an economic slowdown are blamed for the lack of an import market.

## Policy General

Chile's fruit sector has a voluntary export quality program for apples, table grapes, stone fruit and kiwis shipped to the United States and Europe. Nearly 80 percent of Chile's exports to these two markets are under the auspices of this quality program. The minimum standards are voluntary, and this year they will be similar to those of last year. Growers and Exporters have agreed to limit the quality control only to fruit maturity. There are no requirements related to the size of the fruit or to the volumes exported.

## Marketing General

Although Chile is a major producer of table grapes, apples and pears, there are some opportunities for imports, particularly when domestic supplies are low or non-existent in the off-season. A major constraint on demand is price. Consumers are accustomed to low prices for in-season apples. In general, the market for U.S. fresh fruit is limited by the small portion of Chileans who are willing to pay for higher-priced, off-season fruit only about 10 percent of the population.

On the export side, contractual arrangements between producers and exporters vary according to the exporting company. A large portion of Chilean fruit is shipped on a consignment basis. After the exporter sells the fruit in a given market, all marketing and transportation costs are deducted from the sale price. The remaining amount is given to the farmer so that he/she can pay his/her production costs and determine his own profit. Some producers receive a guaranteed minimum price for their fruit from the exporters. In general, some financing is provided to producers during the growing season, which is then deducted from grower receipts at the end of the season.

A generic promotional campaign in the U.S. , Japan and the European Community for all fruits is co-financed by producers and exporters, with Pro-Chile. Approximately 3 to 5 cents of every box shipped to these markets are destined for this purpose. Written media, TV and radio campaigns are used in the United States.

## Fresh Table Grapes

## Production

Good weather for grape production in most areas resulted in an increase in output of table grapes in MY2002 (JanDec 2002). A slightly larger production is forecasted for MY2003 in spite of colder and wet weather again during this spring season.

Chile produces over 36 varieties of table grapes for export. Thompson Seedless, Flame Seedless and Ribier account for the bulk of production. The Red Globe and Superior Seedless varieties have increased significantly in the last few years, as most replanting has been with these varieties. Table Grapes are planted from Region III (Copiapo) to Region VII (Curico-Talca).

## Crop Area

Planted area to table grapes has apparently leveled off. Only small increases have been reported during the last few years. Some of the aging vineyards are being planted with the above mentioned new varieties which better address market demand.

Since planted area is not expected to increase, in the coming years, variations in grape output will be a function of changing yields, due to climatic variations, and newly-planted areas reaching mature stages of production. Table grape vines in Chile provide mature yield levels between 7 and 17 years after planting.

## Consumption

There are no statistics on fresh table grape consumption. A residual figure is used to determine fresh consumption and utilization for processing.

## Trade

The volume of table grape exports is expected to expand beyond production in MY2002 due to strong foreign demand, based on the good quality of the produce. Another expansion is expected in MY2003, as a result of a forecasted increase in production. Although Chile has imported limited amounts of table grapes during the winter months in the past, these are not expected to grow in the coming years due to the devaluation of the Chilean peso and the economic slowdown which has affected disposable income.

## Fresh Pears

## Production

For Marketing Year (MY) 2001 (Jan-Dec 2002) total pear production is expected to be smaller than last year, due to adverse weather in most growing areas. Industry sources indicate that certain pear production areas were adversely affected by cold weather, wind, and rain while the trees were in blossom. Spring weather this year was cold and cloudy again, but it is still early to predict the effect this will have on the volume and quality of production. Nevertheless, industry sources indicate they expect a larger output for MY2002 (Jan-Dec 2003).

There are over 36 pear varieties grown in Chile. Packam's Triumph and Beurre Bosc make up 45 percent and 25 percent of Chile's exports, respectively.

## Consumption

As with most other fruits, only export rejects enter domestic marketing channels. Pears are mostly consumed fresh, although increasing amounts are utilized for processing.

## Trade

Due to quality problems and smaller volumes produced in MY2001, pear exports will be down when compared to the previous year. Exports are forecasted to expand again in MY2002 as a result of a larger production. Chile does not yet import fresh pears.

## Concentrated Apple Juice

## Production

Chile's production of apple juice concentrate (AJC) primarily reflects foreign demand. The increase in production and exports in Marketing Year (MY) 2000 (Jan-Dec, 2001) were mainly due to both a significant increase in foreign demand for AJC and a larger apple production. For MY2001, production volumes are expected to be smaller following the expected fall in apple production. A rebound in apple production in MY2002 (Jan-Dec, 2003) is forecasted to expand juice concentrate production.

Chile's apple export rejects are mostly sent to the processing industry for apple juice production. But as the processing market has become increasingly saturated with supplies, industry buyers have started to place increased attention on the quality of the product. As a result, the AJC industry is both encouraging farmers to increase production of existing orchards of sour-type apples, as well as to expand new planting of apple varieties.

## Consumption

Only small amounts of AJC principally of single-strength juice are consumed domestically. AJC competes with a variety of fresh and processed juices in Chile.

## Trade

The United States is Chile's largest AJC export market (over 80 percent of total export sales). Other important markets are Japan, Mexico and Canada. New and growing markets are primarily located in Latin America. Levels of AJC exports will depend upon foreign demand and the ability of the industry to compete in international markets.
