Passcode: 35206

The *Current* Multisensor Precipitation Estimator (MPE)

- An automated & interactive algorithm that estimates **one-hour rainfall ending at the top of the hour on a ~4-km HRAP grid** using WSR-88D Precip. Processing System's (PPS) Digital Precipitation Array (DPA) products
- **Multisensor**...uses rain gauges and GOES satellite to reduce existing biases in WSR-88D rainfall estimates and produces a suite of radar-gauge-satellite rainfall products
- Produces **regional mosaics** from any desired number of WSR-88Ds

For more details, see the Lab's MPE Training Workshop at <http://www.nws.noaa.gov/oh/hrl/papers/papers.htm#wsr88d>

800-369-1643
Passcode: 35206

The *Current* Multisensor Precipitation Estimator (MPE) (cont.)

- Delivered in AWIPS to RFCs in 2002, WFOs in 2004, to replace and improve upon the existing Stages II & III Precipitation Processing algorithms
- Designed primarily for RFC use
- Primary input to RFC and WFO hydrologic forecast models (NWS River Fcst System NWSRFS and Site Specific Hydr. Predictor SSHP ... but not Flash Flood Monitoring & Prediction FFMP)

MPE Product Suite

- **Radar-only rain mosaic**
- **Gauge-only rain mosaic**
- **Satellite-only rain mosaic (from NESDIS)**
- **Mean field bias-adjusted radar rain mosaic using rain gauges**
- **Local bias-adjusted radar rain mosaic using rain gauges (two different methods)**
- **Multisensor merged radar+gauge mosaic**
- **Multisensor merged radar+gauge+satellite mosaic (coming soon)**

WFO vs. RFC Requirements for Precipitation Products

RFC

- Mainstem river forecasting
- 4 km resolution (HRAP)
- 1 hour updates of hourly rain
- Multisensor mosaics of rainfall accumulation
- Routine manual quality control is modus operandi
- MPE products

WFO

- Flash flood monitoring & warning
- 1 km resolution (1/4 HRAP)
- 5-15 minute updates of sub-hourly and longer rain
- Multisensor mosaics of rainfall and rain rates
- Routine manual quality control may not be feasible
- **Enhanced MPE (EMPE) products**
- **Multisensor Precipitation Nowcaster (MPN) products**

Enhanced MPE (EMPE) is an Experimental Prototype with New Features for WFOs

Same multisensor rainfall estimation technology & products as in MPE, but with ...

- **Higher spatial resolution – ¼ HRAP (~1 km)**
 - *vs. 1 HRAP (~4 km) in current MPE*
- **Higher temporal rainfall resolution – 5-15+ minute rainfall duration**
 - *vs. one hour in current MPE*
- **More frequent updates - 5-15 minutes**
 - *vs. once per hour at top of hour in current MPE*
- **Greater flexibility**
 - *User configurable and “backward compatible”*

History & Status of EMPE

- Initial need identified and AHPS EMPE funding proposal written by Fulton in 2002 and funded FY 2003-2006
- Project plan developed and distributed for review in 2002
- Initial EMPE prototype was completed in 2004 by HSMB's Hydrometeorology Group (F. Ding, S. Guan, R. Fulton)
- In 2004, we set up a real-time 24x7 demonstration in HL for 5 WSR-88Ds in mid-Atlantic region (Sterling KLWX, Pittsburgh KPBZ, Charleston KRLX, Blacksburg KFCX, Wakefield KAKQ)
 - *Web page displays real-time graphical output products*

EMPE Details

- Uses PPS's **Digital Storm-total Precipitation (DSP)** products from multiple radars covering CWA as input
 - *Cumulative rainfall updated every volume scan (~ 5 minutes)*
 - *1 deg x 2 km (higher resolution than 4-km DPA)*
 - 1 deg x 1 km in future (existing HOSIP project)
 - *Digital 256-level equivalent to the Storm Total Precip (STP) 16-level graphical product*
- Differencing of DSPs produces rainfall durations of any arbitrary duration (5 min. to 24+ hours)
 - *DPA's cannot provide durations other than whole 1, 2, 3, ... hrs.*
- Demonstrated ability of differenced DSPs to replicate DPA hourly rainfall on HRAP grid
- Also uses PPS's **Digital Hybrid Scan Reflectivity (DHR)** products to compute instantaneous rain rates
- Both are remapped and mosaicked onto $\frac{1}{4}$ HRAP grid (~1 km)

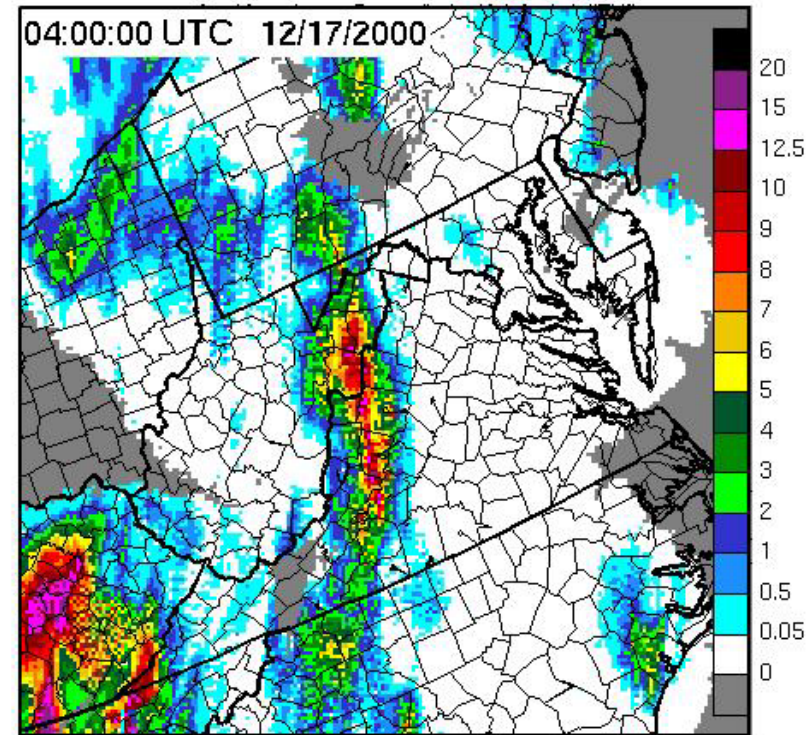

Hourly Rainfall from DPAs and Differenced DSPs Matches Well

One-hour rainfall for mid-Atlantic regional mosaic on 4-km HRAP grid

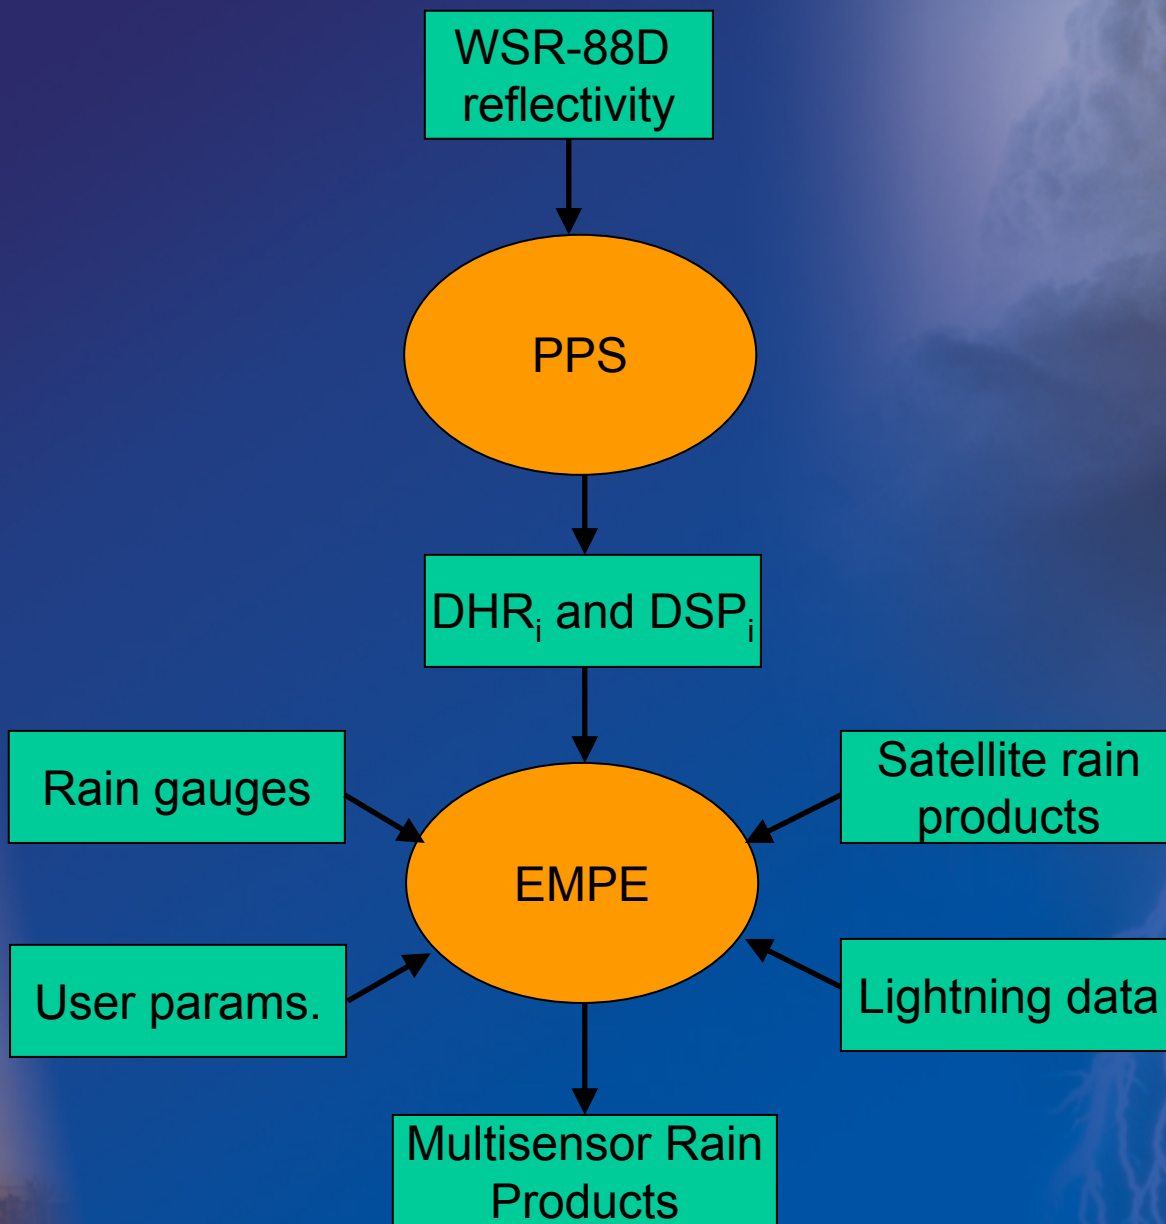

1-HR OBSERVED RAINFALL (mm)

Random differences may be due to:

- 1) Slight differences in polar-to-HRAP remapping software between PPS and EMPE
- 2) ¹³Temporal interpolation

Multisensor Precipitation Estimation and Nowcasting for Flash Floods

A Radar Nowcasting Demonstration Project
 to Improve Flash Flood Forecast and Warning Services
 of the National Weather Service

Introduction

Quantitative precipitation estimation and nowcasting are important components of National Weather Service (NWS) flash flood warning services. They refer to the estimation of rainfall up to the current time using multiple sensors (WSR-88D, rain gauges, satellite data). It is in this new project that we are testing the use of these sensors on current observed data. It is in this new project that we are testing the use of these sensors on current observed data. It is in this new project that we are testing the use of these sensors on current observed data.

Sample EMPE products

The Enhanced Multisensor Precipitation Estimator (E-MPE) is a new prototype algorithm developed by the Hydrology Laboratory (HL) based on the existing operational Multisensor Precipitation Estimator (MPE) that is running at most River Forecast Centers and Weather Forecast Offices. However it has the advantage of higher spatial and temporal resolution than the current MPE, a factor that is necessary if the products are to be useful for flash flood monitoring and warning purposes. Instead of one-hour multisensor rainfall estimates at a nominal 4-km (HRAP) grid scale with updates once per hour as with the current MPE, the E-MPE is more flexible and generates multi-duration rainfall products on a 1-km grid (1/4th HRAP) with updates as often as every 5-15 minutes based on what the user chooses. Details of the current MPE algorithm can be found under the "MPE Training Workshop" link at <http://www.nws.noaa.gov/oh/hrl/papers/papers.htm#wsr88d>.

The Multisensor Precipitation Nowcaster (MPN) algorithm is a prototype rainfall nowcasting algorithm that produces regional, gridded, one-hour rainfall nowcasts using input data generated by the E-MPE. The MPN is an enhancement of the Flash Flood Potential (FFP) algorithm, also developed at the HL, that uses current and recent-past WSR-88D radar data to estimate the future location of storms, their associated rainfall, and flash flood threat up to one hour into the future.

These E-MPE and MPN products can be used as input to distributed hydrologic forecast models or other flash flood monitoring tools at the Weather Forecast Offices. Short-term rainfall nowcasts can provide forecasters with additional information on the timing and location of rainfall events, which can be used to improve flash flood forecasting.

EMPE User Configuration

Vision is One Configurable EMPE
that Serves both **WFOs** and **RFCs**

- Choose desired spatial grid resolution
 - **¼ HRAP** or **1 HRAP**
- Choose desired rainfall durations
 - **Rainrates, 15 min., 30 min., 1 hr., etc.** rainfall durations
- Choose desired run-time delay (~minutes)
 - *May depend on each product*
 - *Gauge-adjusted products may need longer time delays*
- Choose a product generation schedule that satisfies your requirements...

EMPE User Configuration (cont.)

A Sample Product Generation Schedule

Time (min.)	EMPE Products				
	Rain Rate (mm/hr)	RMOSAIC 15 min (mm)	BMOSAIC 30 min (mm)	BMOSAIC 60 min (mm)	MMOSAIC 60 min (mm)
H+0	✓	✓	✓	✓ ✓	✓
H+5	✓				
H+10	✓				
H+15	✓	✓			
...	✓				
H+30	✓	✓	✓		
...	✓				
H+45	✓	✓			
...	✓				
H+55	✓				

Etc.

EMPE Considerations

- **Increased CPU, memory, disk space, and communication bandwidth requirements**
- **Digital Storm-total Precipitation (DSP) product issues**
 - ***Wide area distribution is necessary from multiple non-associated radars for mosaicking (DHR also)***
 - **Revising an existing WSR-88D Request for Change (RC)**
 - ***Don't apply G-R bias to DSP***
 - **PPS code needs to be revised; RC was submitted in Feb.**
- **Rain gauge issues**
 - ***Rain gauge data is a double-edged sword that requires QC before use***
 - ***WFOs often don't have resources to do real-time manual gauge QC as at RFCs***
 - ***Automated quality control methods are critical***
 - ***Anticipated use of RFC QC'ed precipitation analyses for previous 1-6 hours***

EMPE will be Integrated within NWS Hydrologic Operations

- **On-going science infusion in PPS will be reflected in downstream EMPE products (e.g., Range Correction Algorithm RCA, rainrate-dependent bias adjustment, dual polarization)**
- **Science infusion in MPE is on-going (e.g., probabilistic QPE, satellite QPE)**
- **Provides all necessary input to drive the Multisensor Precipitation Nowcaster**
- **Enables/enhances high resolution distributed hydrologic forecast modeling and other flash flood tools (distributed hydrologic forecast models, FFMP, flood inundation mapping)**

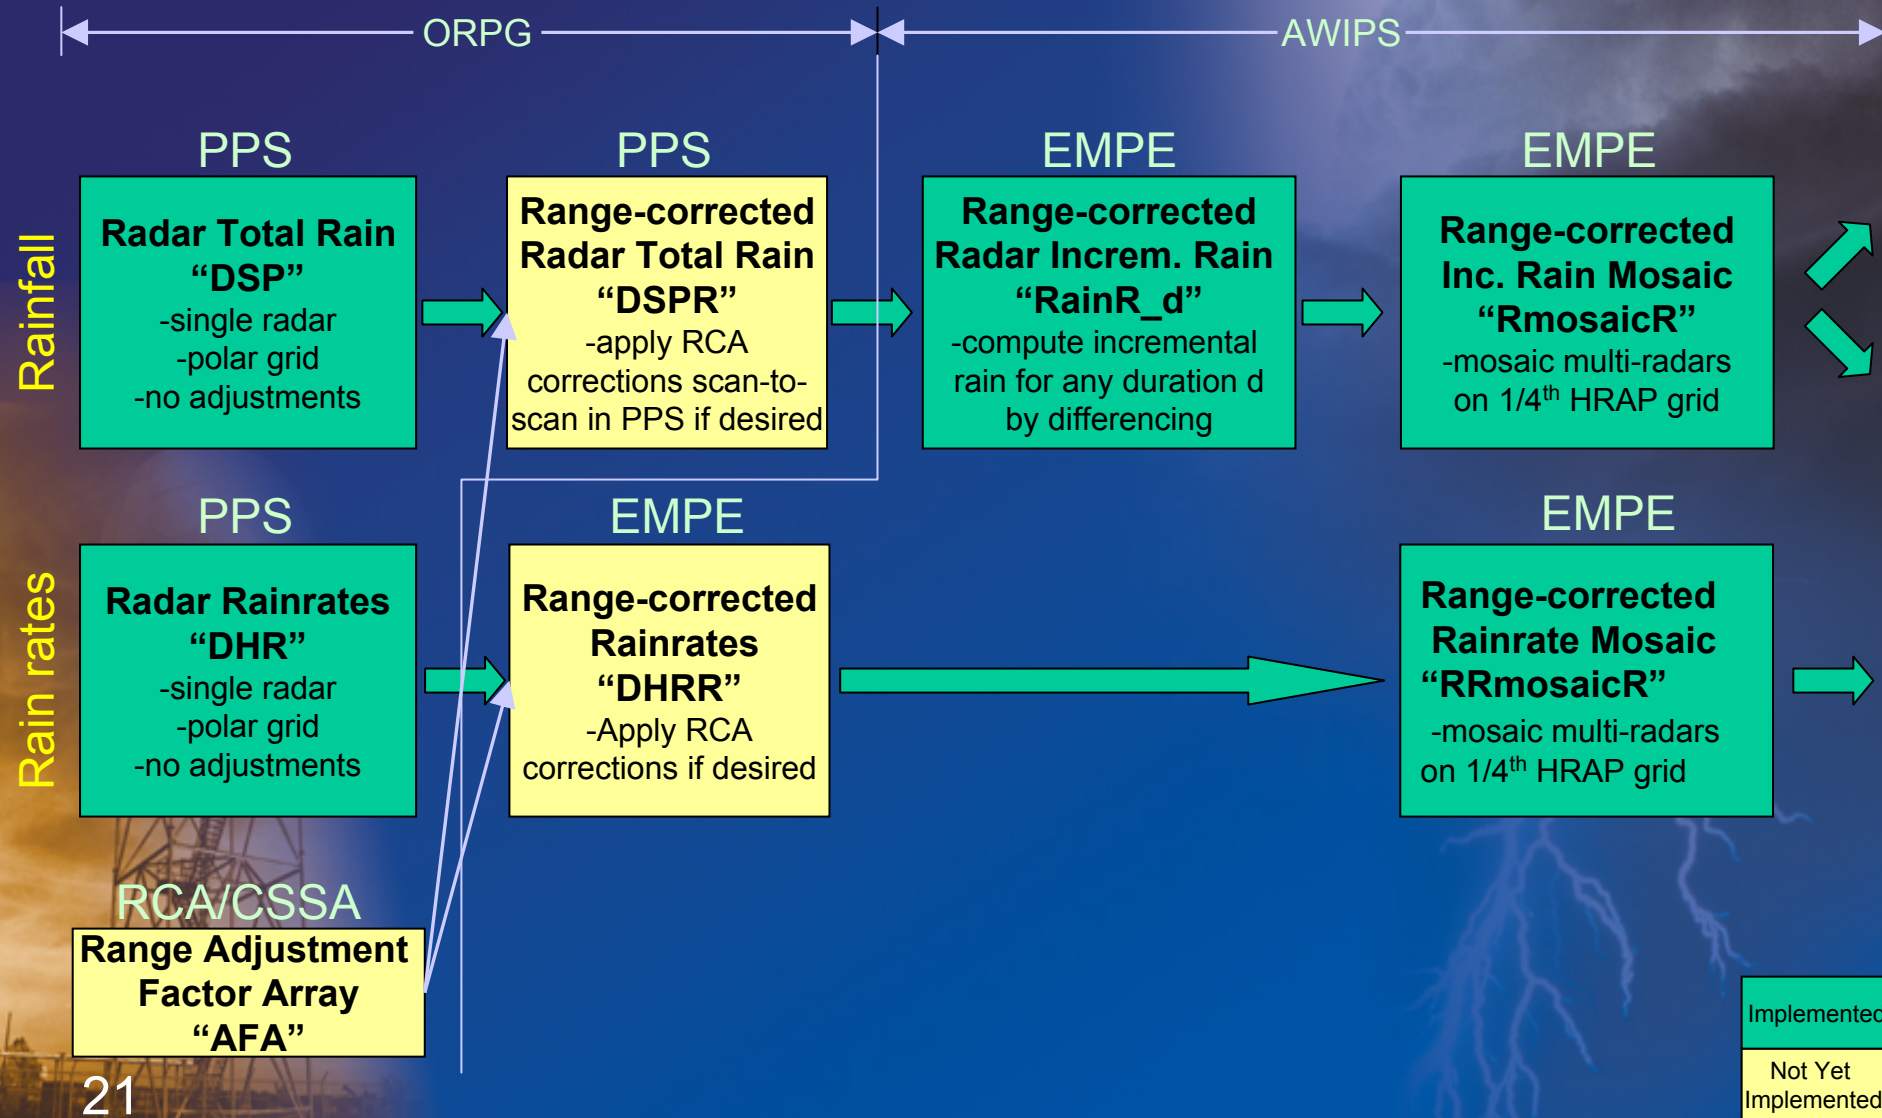

Types of Radar QPE Adjustments

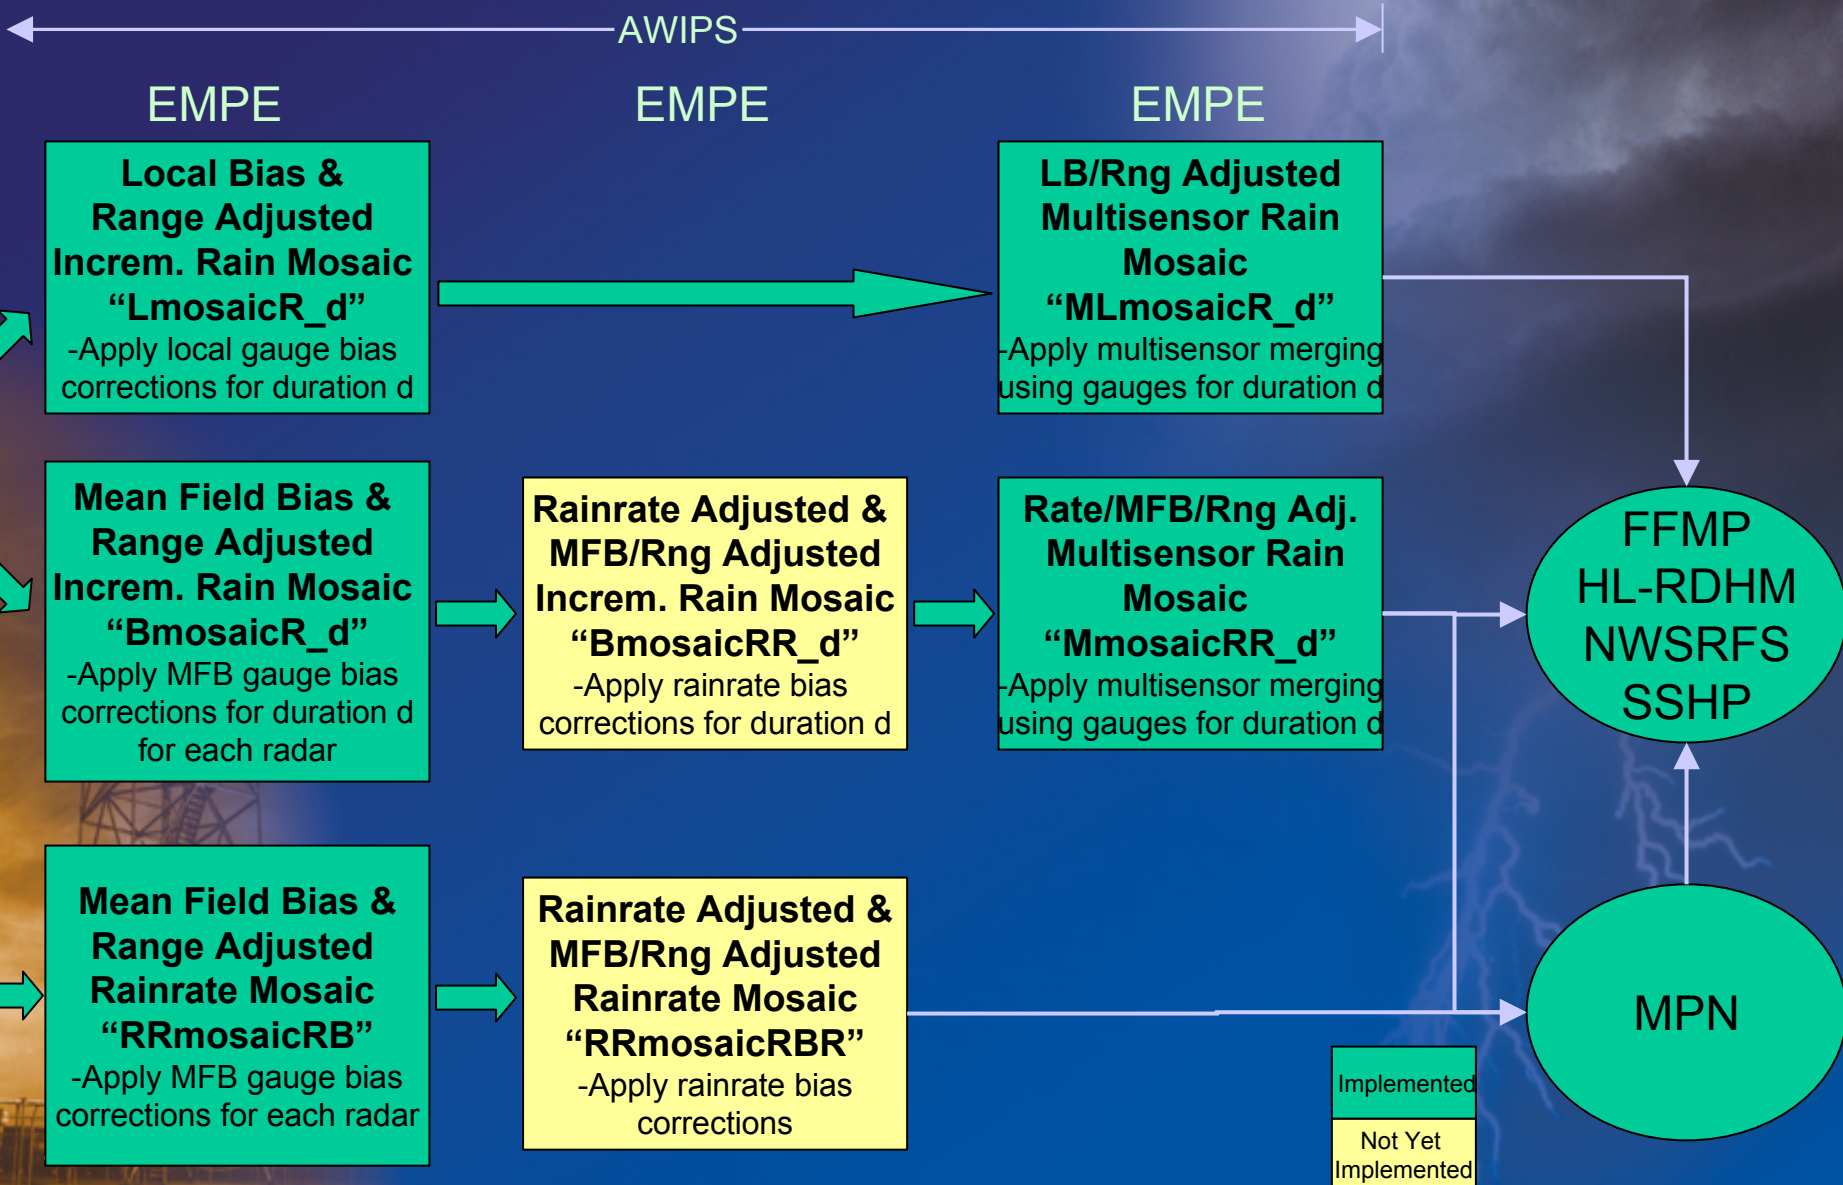

- **Adjustments using radar data**
 - *Range-related biases*
 - Experimental Range Correction Algorithm (RCA)
 - Beam broadening
 - *Rain rate-dependent biases*
 - see Probabilistic QPE final report on our web page
- **Adjustments using rain gauges**
 - *Radar-wide mean field bias (MPE's Bmosaic)*
 - *Local bias (MPE's Lmosaic, P3)*
 - *Multisensor merging (MPE's Mmosaic)*
- **Adjustments using satellite QPE**
 - *Multisensor merging (radar+gauge+satellite; under development for MPE)*

Proposed End-to-End Sequence of Bias Correction Procedures in EMPE/MPN

Proposed End-to-End Sequence of Bias Correction Procedures in EMPE/MPN (cont.)

Looking into the Future to Increase Flash Flood Warning Lead Times

- **Rainfall nowcasting:** Extrapolating current (radar) rainfall observations into the very near future (1-3 hours)
 - *Predictability of rain depends on predictability of rainfall system...convective vs. stratiform & seasonal dependence*
- **NWS currently has no rainfall nowcasting capability that is integrated quantitatively within hydrologic fcst operations**
 - *SCAN Categorical QPF algorithm, WSR-88D Storm Cell Identification and Tracking (SCIT) used for visual analysis only*
 - *UK Met Office has been doing this for a while*
- **Even simpler automated nowcast techniques have potential to move us to the next flash flood warning performance level (possibly ~ten minutes vs. current few minutes)**
 - *We can automate and quantify what goes on in a forecaster's head when they view radar loops*

Multisensor Precipitation Nowcaster (MPN)

- For Flash Flood Forecasting -

- **Automatically produces deterministic 1-hr rainfall forecasts and flash flood threat probabilities using extrapolation techniques**
- **4-km forecast grids, updated every 5-15 minutes as needed**
- **Multisensor – uses WSR-88D radar with rain gauge-based mean field bias adjustments**
- **Regional – uses mosaicked WSR-88Ds covering the county warning area**
- **Is integrated with EMPE; EMPE produces all necessary input data to drive it**

History and Status of MPN

- **MPN is an extension of HL's Flash Flood Potential (FFP) algorithm**
 - *FFP was originally single-radar, single-sensor*
 - *AHPS supported the upgrade to multiradar, multisensor using EMPE product input*
- **Initial AHPS funding proposal for MPN written by Fulton in 2002 and funded FY 2003-2006**
- **Project plan developed and distributed for review in 2002**
- **Initial MPN prototype was completed in 2004 by HSMB's Hydrometeorology Group (S. Guan, F. Ding, R. Fulton)**
- **In 2004, we set up a real-time 24x7 demonstration in HL for 5 WSR-88Ds in mid-Atlantic region (Sterling KLWX, Pittsburgh KPBZ, Charleston KRLX, Blacksburg KFCX, Wakefield KAKQ)**
- **Web page shows real-time graphical output products**
- **MPN project is in OSIP Stage 2**

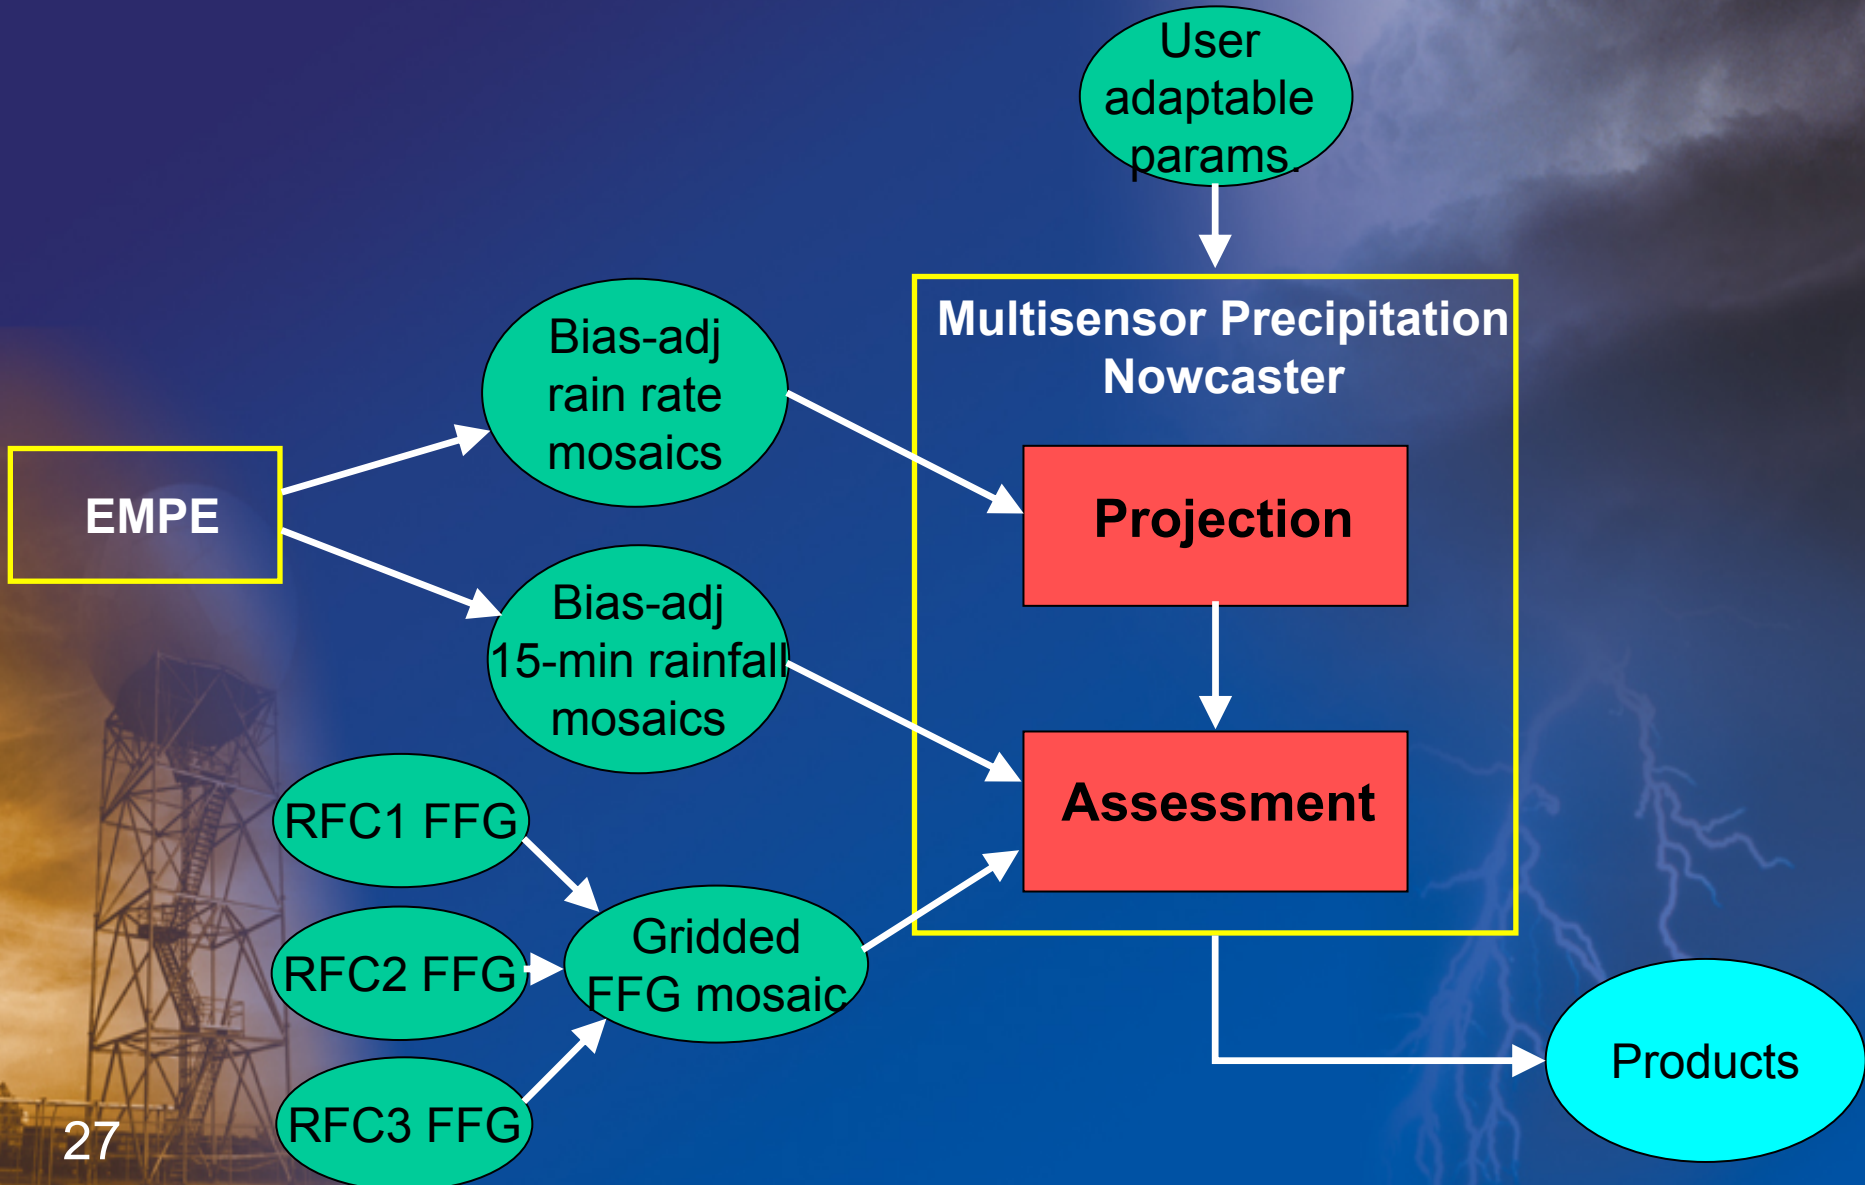

MPN has Two Components

- **Rainfall Projection** algorithm
 - *Produces 1-hour gridded rainfall nowcasts based on extrapolation of recent WSR-88D and rain gauge observations*
- **Flash Flood Threat Assessment** algorithm
 - *Computes observed and forecasted gridded probabilities of exceeding 1-, 3-, and 6-hr Flash Flood Guidances (FFG)*

MPN Data Flow

MPN Details

Pt. 1: Rainfall Projection Algorithm

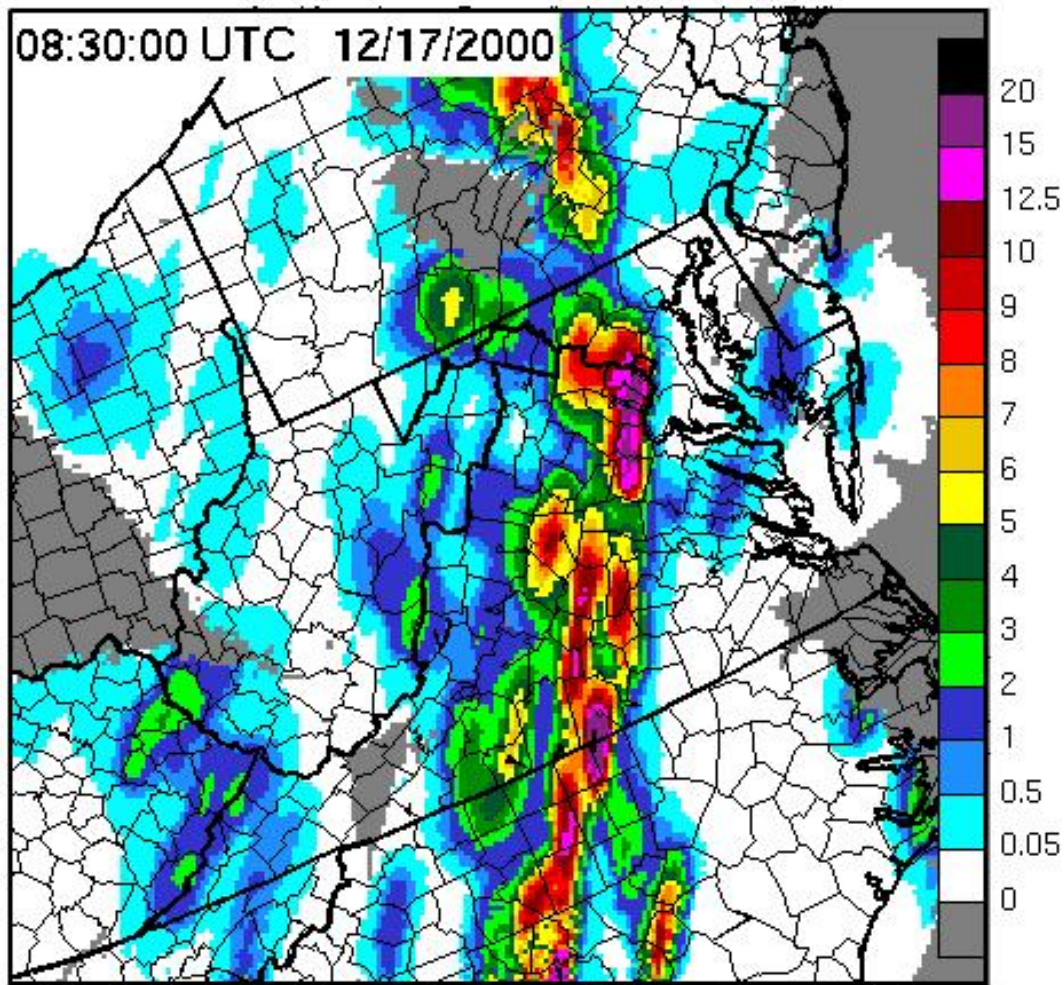

- **Generates one-hour rainfall nowcasts on HRAP grid (~4 km) with 5-15 minute update frequency as needed**
 - *Meager justification currently for going to higher spatial resolution*
 - *Extending forecasts beyond 1 hour is easily doable, but accuracy degrades quickly beyond ~1 hour in summer convection*
- **Local pattern matching technique using two consecutive gridded radar rain rate mosaics ~15-20 minutes apart produces local storm motion vectors**
 - *Vectors delineate storm motion at a ~20 km grid scale*
 - *Automated vector quality control*
- **Advect and integrate current mean field bias-adjusted rain rate mosaic one hour into future using observed storm vectors**
 - *Several progressive spatial smoothing options are available to minimize forecast error*
- **Local lagrangian storm growth and decay can be accounted for in forecasts if desired**

Multisensor Precipitation Estimation and Nowcasting for Flash Floods

A Radar Nowcasting Demonstration Project
to Improve Flash Flood Forecast and Warning Services
of the National Weather Service

Introduction

Quantitative precipitation estimation and nowcasting are important components of National Weather Service (NWS) flash flood warning services. They refer to the estimation of rainfall up to the current time using multiple sensors (WSR-88D, rain gauges, satellite estimates) and the estimation of rainfall in the future based heavily on current observed data. It is in this near real-time environment that the current products currently have lesser precipitation forecast skill than expected.

MPN products

The Enhanced Multisensor Precipitation Estimator (E-MPE) is a new prototype algorithm developed by the Hydrology Laboratory (HL) based on the existing operational Multisensor Precipitation Estimator (MPE) that is running at most River Forecast Centers and Weather Forecast Offices. However it has the advantage of higher spatial and temporal resolution than the current MPE, a factor that is necessary if the products are to be useful for flash flood monitoring and warning purposes. Instead of one-hour multisensor rainfall estimates at a nominal 4-km (HRAP) grid scale with updates once per hour as with the current MPE, the E-MPE is more flexible and generates multi-duration rainfall products on a 1-km grid (1/4th HRAP) with updates as often as every 5-15 minutes based on what the user chooses. Details of the current MPE algorithm can be found under the "MPE Training Workshop" link at <http://www.nws.noaa.gov/oh/hrl/papers/papers.htm#wsr88d>.

The Multisensor Precipitation Nowcaster (MPN) algorithm is a prototype rainfall nowcasting algorithm that produces regional, gridded, one-hour rainfall nowcasts using input data generated by the E-MPE. The MPN is an enhancement of the Flash Flood Potential (FFP) algorithm, also developed at the HL, that uses current and recent-past WSR-88D radar data to estimate the future location of storms, their associated rainfall, and flash flood threat up to one hour into the future.

These E-MPE and MPN products can be used as input to distributed hydrologic forecast models or other flash flood monitoring tools at the Weather Forecast Offices. Short-term rainfall nowcasts can provide forecasters with additional

MPN Verification: Are the Nowcasts Any Good?

- **Verification of forecasted instantaneous rain rates and hourly forecast accumulations...**
 - ***Against radar observations (completed)***

Rain gauge data was not used

Bias = $\frac{\sum(\text{fcst rain})}{\sum(\text{obs rain})}$

Using Rainfall Nowcasts in a Distributed Hydrologic Forecast Model (HL-RDM)

- **Forecast hydrographs using 1-hr MPN rain nowcasts are consistently better than assuming zero QPF based on 9 intense rain events**
 - *Reed, Fulton, Zhang, Guan (2006)*
- **Demonstrated potential flash flood lead time gained**
- **A component of S. Reed's HOSIP project "Distributed Hydrologic Modeling for Flash Flood Forecasting"**
- **Potential for use in Site Specific Hydrologic Predictor (SSHP)**
- **Potential for linking hydro forecasts to high-res GIS-based flood inundation mapping capabilities for emergency managers**

Reed, Fulton, Zhang, Guan, 2006: Use of 4-km, 1-hr precipitation forecasts to drive a distributed hydrologic model for flash flood prediction. 20th Hydrology Conference.

Hydrograph Forecast Accuracy at Different Lead Times (Reed et al. 2006)

- Lead times are computed relative to the simulated peak time.
- All results shown are for CAVESP (90 km²) and single Event (7/2004)

Peak errors of different forecasts relative to simulated flows as a function of lead time

Implementation**

Recent and Projected WFO Flash Flood Warning Performance

- *Flash Flood Warning verification statistics are based on product issuance information and confirmation of actual flash floods by the local WFOs*
 - *Flash Flood Warning Lead Time*
 - *Flash Flood Warning Accuracy*

	<i>FY03</i>	<i>FY04</i>	<i>FY05</i>	<i>FY06</i>	<i>FY12</i>
	<i>Actual</i>	<i>Actual</i>	<i>Actual</i>	<i>Goal</i>	<i>Goal</i>
<i>Lead Time (minutes)</i>	41	48	54	48	51
<i>Accuracy (%)</i>	89	89	88	89	91

EMPE and MPN, when integrated with other WFO hydrology tools, have the potential to greatly increase future performance

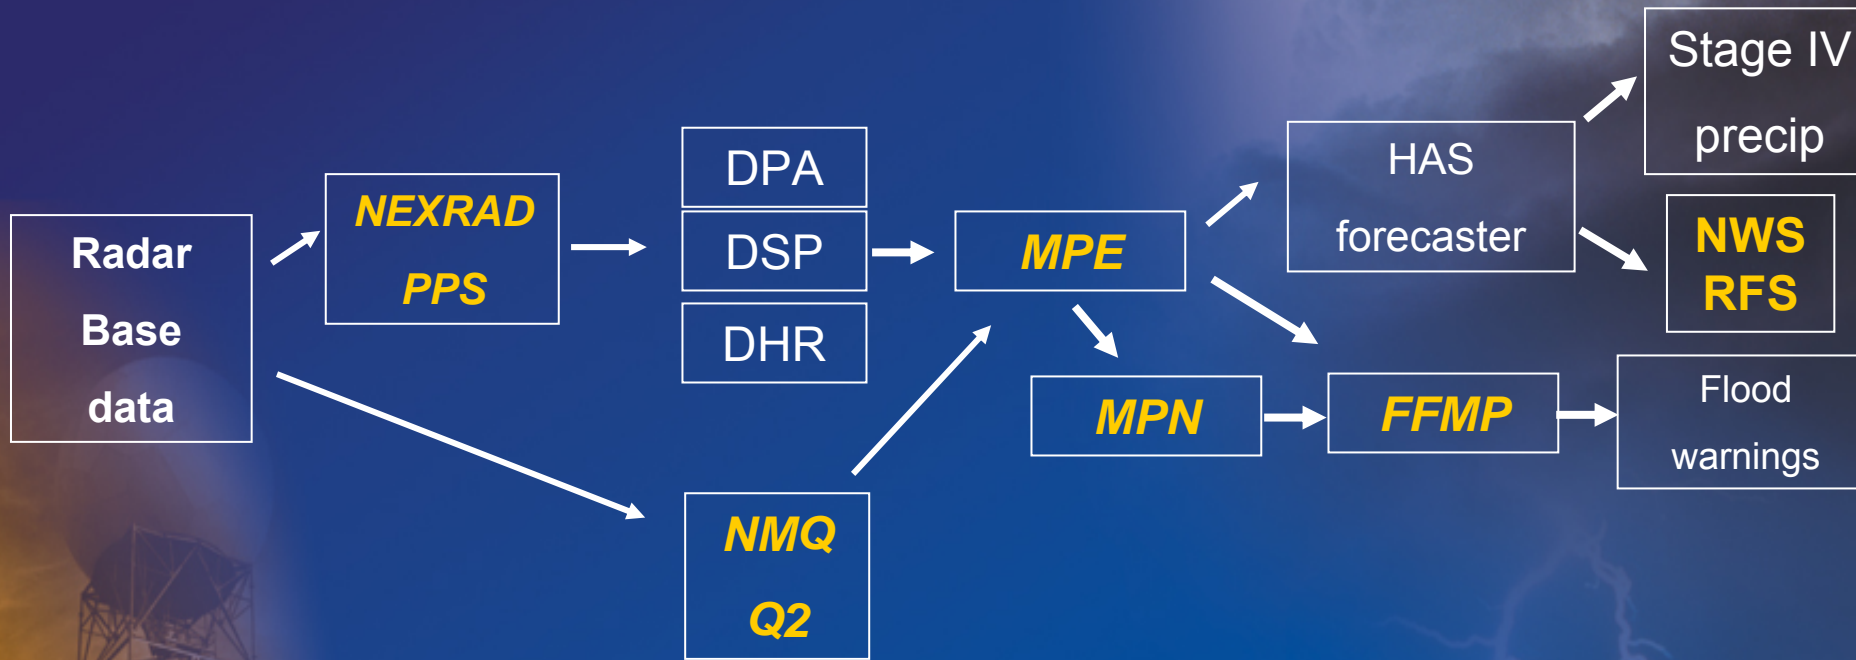

NSSL-OHD Collaboration on Precipitation Estimation

- ***Program goal: Improved precipitation estimates for RFC's and WFO's***
- ***Current focus is on identifying best features of Next-Generation Multisensor Precipitation Estimation (Q2) and AWIPS Multisensor Precipitation Estimator (MPE) algorithms through a hydrologic simulation experiment***
 - ***Focus on Tar River basin in North Carolina***
 - ***Retrospective precipitation analyses will be prepared for North Carolina***
 - ***Q2 and MPE precipitation analyses incorporating different combinations of input and algorithms will be used to drive OHD's research distributed hydrologic model HL-RDHM***
 - ***Precipitation evaluation will be based on comparisons with a set of reference rain gauges and stream gauges***

Anticipated Operational Data Flow (Subject to Later Revision)

Radar input comes from WSR-88D, TDWR, other networks

Science improvements tested in Q2 will be implemented in Q2, NEXRAD PPS, and MPE

Conclusion

- **The Enhanced Multisensor Precipitation Estimator and Nowcaster can enable improved WFO performance results and new diverse flash flood services**
