

$$J = \frac{1}{2}$$

τ discovery paper was PERL 75. $e^+e^- \rightarrow \tau^+\tau^-$ cross-section threshold behavior and magnitude are consistent with pointlike spin-1/2 Dirac particle. BRANDELIK 78 ruled out pointlike spin-0 or spin-1 particle. FELDMAN 78 ruled out $J = 3/2$. KIRKBY 79 also ruled out $J=\text{integer}$, $J = 3/2$.

¹BAI 96 fit $\sigma(e^+e^- \rightarrow \tau^+\tau^-)$ at different energies near threshold.

²BALEST 93 fit spectra of minimum kinematically allowed τ mass in events of the type $e^+e^- \rightarrow \tau^+\tau^- \rightarrow (\pi^+ n\pi^0\nu_\tau)(\pi^- m\pi^0\nu_\tau)$ $n \leq 2$, $m \leq 2$, $1 \leq n+m \leq 3$. If $m_{\nu_\tau} \neq 0$, result increases by $(m_{\nu_\tau}^2/1100 \text{ MeV})$.

³ALBRECHT 92M fit τ pseudomass spectrum in $\tau^- \rightarrow 2\pi^-\pi^+\nu_\tau$ decays. Result assumes $m_{\nu_\tau} = 0$.

⁴BACINO 78B value comes from $e^\pm X^\mp$ threshold. Published mass 1782 MeV increased by 1 MeV using the high precision $\psi(2S)$ mass measurement of ZHOLENTZ 80 to eliminate the absolute SPEAR energy calibration uncertainty.

⁵BAI 92 fit $\sigma(e^+e^- \rightarrow \tau^+\tau^-)$ near threshold using $e\mu$ events.

τ^- DECAY MODES

τ^+ modes are charge conjugates of the modes below. “ h^\pm ” stands for π^\pm or K^\pm . “ ℓ ” stands for e or μ . “Neutral” means neutral hadron whose decay products include γ 's and/or π^0 's.

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level
Modes with one charged particle		
Γ_1 particle $^- \geq 0$ neutrals $\geq 0 K_L^0 \nu_\tau$ (“1-prong”)	$(84.71 \pm 0.13) \%$	S=1.2
Γ_2 particle $^- \geq 0$ neutrals $\geq 0 K^0 \nu_\tau$	$(85.30 \pm 0.13) \%$	S=1.2
Γ_3 $\mu^- \bar{\nu}_\mu \nu_\tau$	[a] $(17.37 \pm 0.09) \%$	
Γ_4 $\mu^- \bar{\nu}_\mu \nu_\tau \gamma$	[b] $(3.0 \pm 0.6) \times 10^{-3}$

**Lepton Family number (LF), Lepton number (L),
or Baryon number (B) violating modes
(In the modes below, ℓ means a sum over e and μ modes)**

L means lepton number violation (e.g. $\tau^- \rightarrow e^+ \pi^- \pi^-$). Following common usage, LF means lepton family violation *and not* lepton number violation (e.g. $\tau^- \rightarrow e^- \pi^+ \pi^-$). B means baryon number violation.

CONSTRAINED FIT INFORMATION

An overall fit to 65 branching ratios uses 141 measurements and one constraint to determine 29 parameters. The overall fit has a $\chi^2 = 94.2$ for 113 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

A REVIEW GOES HERE – Check our WWW List of Reviews

τ^- BRANCHING RATIOS

$$\Gamma(\text{particle}^- \geq 0 \text{ neutrals} \geq 0K_L^0 \nu_\tau \text{ ("1-prong")})/\Gamma_{\text{total}} \quad \Gamma_1/\Gamma$$

$$\Gamma_1/\Gamma = (\Gamma_3 + \Gamma_5 + \Gamma_9 + \Gamma_{10} + \Gamma_{13} + \Gamma_{15} + \Gamma_{19} + \Gamma_{20} + \Gamma_{23} + \Gamma_{24} + \Gamma_{26} + 0.6569\Gamma_{32} + 0.6569\Gamma_{34} + 0.6569\Gamma_{36} + 0.6569\Gamma_{38} + 0.4316\Gamma_{41} + 0.708\Gamma_{110} + 0.09\Gamma_{128} + 0.09\Gamma_{129})/\Gamma$$

The charged particle here can be e , μ , or hadron. In many analyses, the sum of the topological branching fractions (1, 3, and 5 prongs) is constrained to be unity. Since the 5-prong fraction is very small, the measured 1-prong and 3-prong fractions are highly correlated and cannot be treated as independent quantities in our overall fit. We arbitrarily choose to use the 3-prong fraction in our fit, and leave the 1-prong fraction out. We do, however, use these 1-prong measurements in our average below. The measurements used only for the average are marked "avg," whereas "f&a" marks a result used for the fit and the average.

$\Gamma(\mu^- \bar{\nu}_\mu \nu_\tau) / \Gamma_{\text{total}}$

Γ_3 / Γ

Data marked "avg" are highly correlated with data appearing elsewhere in the Listings, and are therefore used for the average given below but not in the overall fits. "f&a" marks results used for the fit and the average.

To minimize the effect of experiments with large systematic errors, we exclude experiments which together would contribute 5% of the weight in the average.

0.23 ± 0.10 10 ²⁹ WU 90 MRK2 $E_{\text{cm}}^{ee} = 29$ GeV

²⁸ ALEXANDER 96S impose requirements on detected γ 's corresponding to a τ -rest-frame energy cutoff $E_\gamma > 20$ MeV.

²⁹ WU 90 reports $\Gamma(\mu^- \bar{\nu}_\mu \nu_\tau \gamma) / \Gamma(\mu^- \bar{\nu}_\mu \nu_\tau) = 0.013 \pm 0.006$, which is converted to $\Gamma(\mu^- \bar{\nu}_\mu \nu_\tau \gamma) / \Gamma_{\text{total}}$ using $\Gamma(\mu^- \bar{\nu}_\mu \nu_\tau \gamma) / \Gamma_{\text{total}} = 17.35\%$. Requirements on detected γ 's correspond to a τ rest frame energy cutoff $E_\gamma > 37$ MeV.

$\Gamma(e^- \bar{\nu}_e \nu_\tau) / \Gamma_{\text{total}}$ Γ_5 / Γ

Data marked "avg" are highly correlated with data appearing elsewhere in the Listings, and are therefore used for the average given below but not in the overall fits. "f&a" marks results used for the fit and the average.

To minimize the effect of experiments with large systematic errors, we exclude experiments which together would contribute 5% of the weight in the average.

0.31 ± 0.12 ± 0.04	f&a	ACCIARRI	95F L3	1991–1993 LEP runs
<p>103 BARATE 98E obtain this value by adding twice their $B(\pi^- K_S^0 K_S^0 \nu_\tau)$ value to their $B(\pi^- K_S^0 K_L^0 \nu_\tau)$ value.</p>				
<p>104 We multiply the COAN 96 measurement $B(h^- K_S^0 K_S^0 \nu_\tau) = (0.023 \pm 0.005 \pm 0.003)\%$ by 4 to obtain the listed value. This factor of 1/4 is uncertain, and might be as large as 1/2, due to Bose-Einstein correlations and the resonant parentage of this state.</p>				

WEIGHTED AVERAGE
0.116±0.028 (Error scaled by 1.5)

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

$$\Gamma(\pi^- K^0 \bar{K}^0 \nu_\tau) / \Gamma_{\text{total}} (\%)$$

$$\Gamma(\pi^- K_S^0 K_S^0 \nu_\tau) / \Gamma_{\text{total}} \quad \Gamma_{42} / \Gamma = \frac{1}{4} \Gamma_{41} / \Gamma$$

Bose-Einstein correlations might make the mixing fraction different than 1/4.

$0.742 \pm 0.035 \pm 0.020$	8000	ALBRECHT	90E ARG	$E_{cm}^{ee} = 9.4\text{--}10.6$ GeV

¹⁹⁵ Combined fit to ARGUS tau decay parameter measurements in ALBRECHT 98, ALBRECHT 95C, ALBRECHT 93G, and ALBRECHT 94E. ALBRECHT 98 use tau pair events of the type $\tau^- \tau^+ \rightarrow (\ell^- \bar{\nu}_\ell \nu_\tau)(\pi^+ \pi^0 \bar{\nu}_\tau)$, and their charged conjugates.

¹⁹⁶ ABE 97O assume $\eta^\tau = 0$ in their fit. Letting η^τ vary in the fit gives a ρ^τ value of $0.69 \pm 0.13 \pm 0.05$.

¹⁹⁷ Value is from a simultaneous fit for the ρ^τ and η^τ decay parameters to the lepton energy spectrum. Not independent of ALBRECHT 90E $\rho^\tau(e \text{ or } \mu)$ value which assumes $\eta^\tau = 0$. Result is strongly correlated with ALBRECHT 95C.

¹⁹⁸ Combined fit to ARGUS tau decay parameter measurements in ALBRECHT 95C, ALBRECHT 93G, and ALBRECHT 94E.

$\rho^\tau(e)$ PARAMETER

($V-A$) theory predicts $\rho = 0.75$.
