# Transition Scenarios

Leon Clarke, Jae Edmonds, Joshua Lurz, Marshall Wise

GTSP Annual Meeting

May 24, 2007

**Battelle**

**Pacific Northwest  
National Laboratory**  
Operated by Battelle for the  
U.S. Department of Energy

# What Scenarios Should We be Considering?

- ▶ Many long-term, global scenarios have assumed efficient carbon regimes: all countries participate fully in mitigation from the outset.
- ▶ Reality is unlikely meet this ideal.
- ▶ Strategy must consider the more likely possibility of a less coordinated and efficient future.
  - What policy structures are possible or likely?
  - What might these policy structures imply for the costs and burdens of stabilization?
  - What might they imply for strategic decisions such as technology development and deployment?

# The Pocantico Process

A look at specific policy proposals.

# Outline of this Research: Second-Best Paths to Stabilization

- ▶ Consider stabilization at four levels: 450 ppm, 550 ppm, 650 ppm, and 750 ppm.
- ▶ Consider four stabilization regimes:
  - Set 1: Idealized—perfect global where and when flexibility.
  - Set 2: Add graduated accession—some countries wait to participate.
  - Set 3: Add regionally differentiated regimes—participating countries face differentiated carbon prices.
  - Set 4: Add sectorally differentiated regimes—sectors face differentiated carbon prices.
- ▶ We will talk about the first three of these today.

# The Reference Scenario

**Battelle**

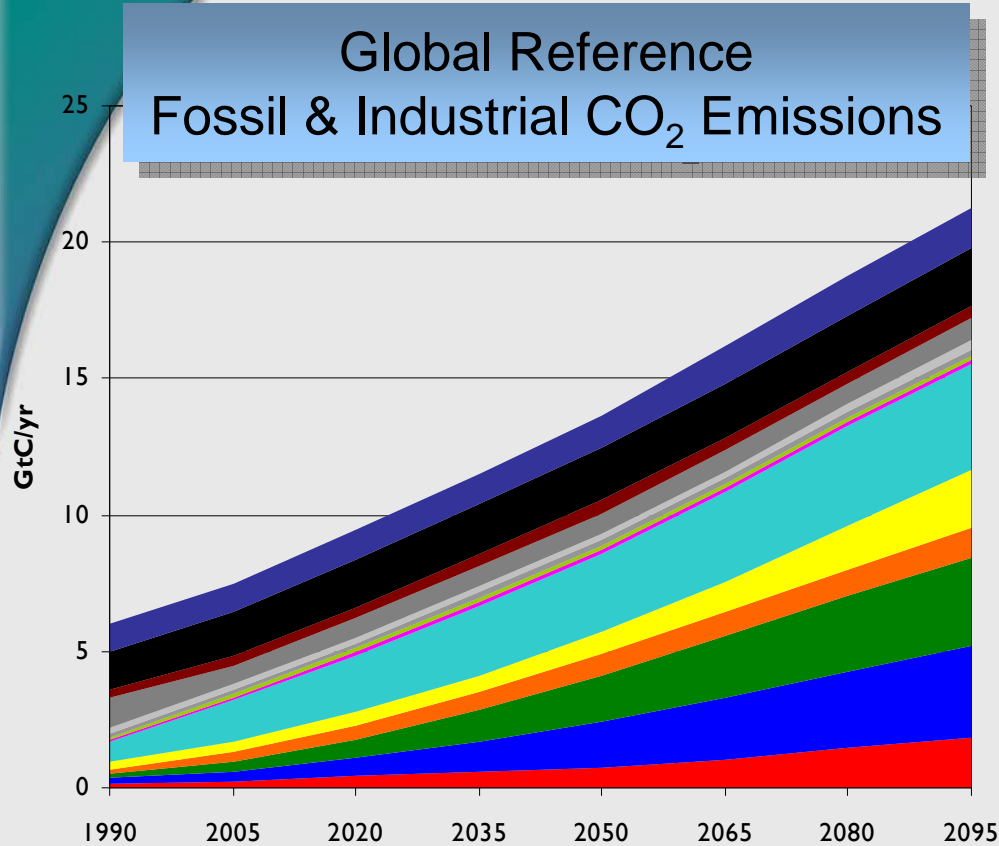

**Pacific Northwest National Laboratory**  
Operated by Battelle for the U.S. Department of Energy

# The GTSP Reference Scenario

## The Importance of Participation

Global Reference  
Fossil & Industrial CO<sub>2</sub> Emissions

- Africa
- Middle East
- Korea
- Eastern Europe
- USA
- India
- Latin America
- Australia\_NZ
- Former Soviet Union
- Western Europe
- Southeast Asia
- China
- Canada
- Japan

Global Emissions in  
Reference & Stabilization

**GTSP**

Global Energy Technology  
Strategy Program

# Stabilization Set I Full Participation

**Battelle**

**Pacific Northwest National Laboratory**  
Operated by Battelle for the U.S. Department of Energy

# Scenario Set I: Full Participation

- ▶ Stabilize CO<sub>2</sub> concentrations
  - 450 ppm, 550 ppm, 650 ppm.
  - Sectoral carbon prices—All EQUAL.
  - Regional carbon prices—All EQUAL.
  - Time path of carbon prices—Peck-Wan-Hotelling.
- ▶ Notes:
  - We have chosen CO<sub>2</sub> rather than radiative forcing for simplicity. We have further simplified the analysis by assuming a fixed agriculture-land-use emissions path. Unmanaged ecosystem extent and composition is fixed.
  - This case sets an economically efficient benchmark for comparison with other cases.

# Scenario Set I

## The Global Carbon Price

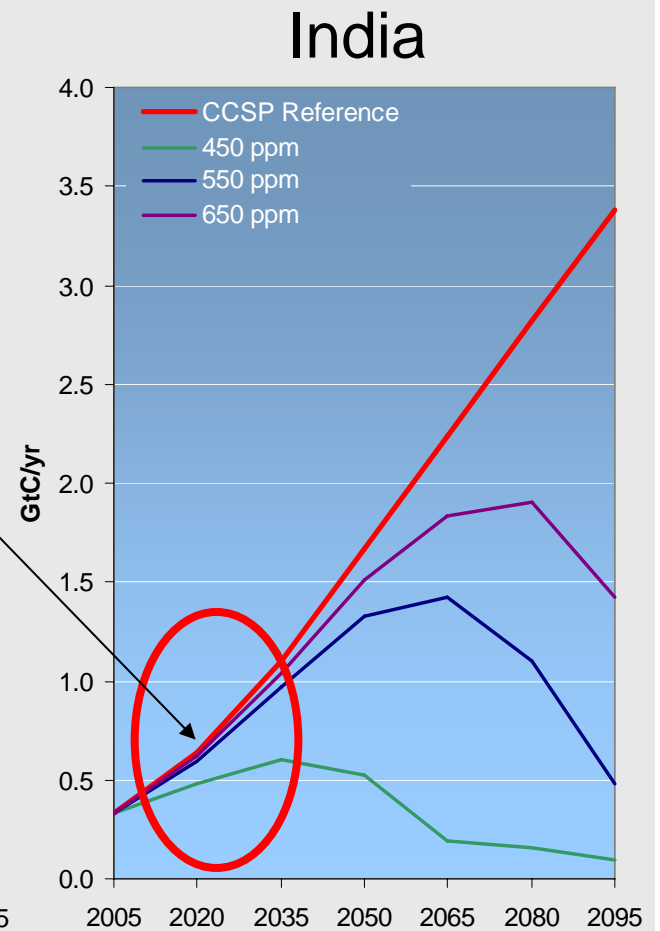

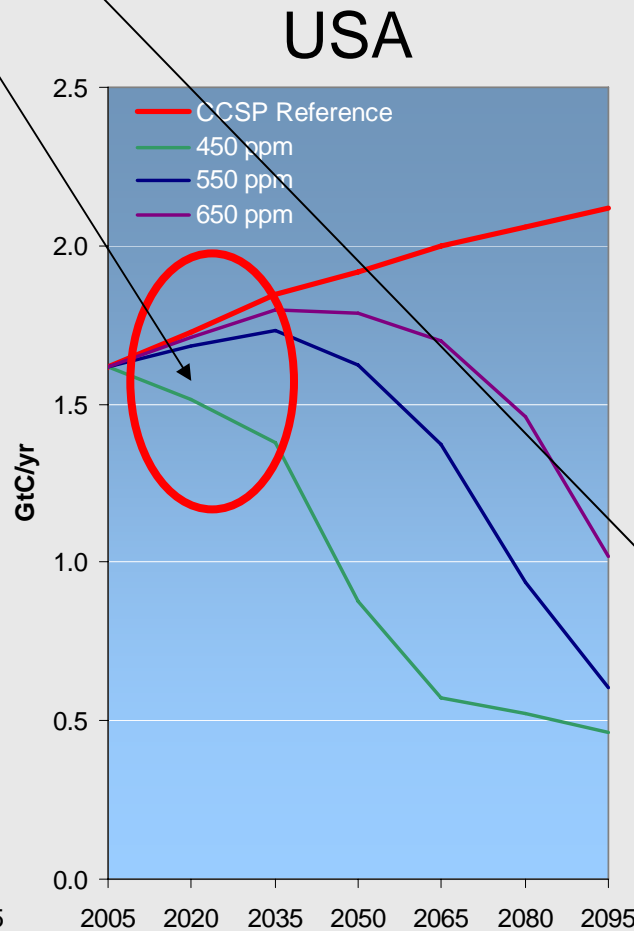

The carbon price rises at roughly the rate of interest until stabilization is reached.

Today's price depends on tomorrow's technology

# GTSP

450 ppm has fundamentally different near-term implications than 550 ppm and above

# Scenario Set I Industrial CO<sub>2</sub> Emissions

**GTSP**

Global Energy Technology  
Strategy Program

# Stabilization Set 2

# Graduated Accession

**Battelle**

**Pacific Northwest National Laboratory**  
Operated by Battelle for the U.S. Department of Energy

# Stabilization Scenario Set 2

## Graduated Accession

- ▶ Stabilize CO<sub>2</sub> concentrations
  - 450 ppm, 550 ppm, 650 ppm.
  - Sectoral carbon prices—All EQUAL.
  - Regional carbon prices—All EQUAL.
  - Time path of carbon prices—Peck-Wan-Hotelling.
  - Staggered accession based on per capita income.
    - Alternative accession cases—first group enters: 2020-2035, 2035-2050, 2050-2065
- ▶ Notes:
  - We assume that all Annex I nations participate in an international protocol by 2020 and that others join at different times based on per capita income. Non-Annex I participation is keyed to China's entry date.

Countries come in at  
the global market price  
of carbon

# Order of Regional Participation (1<sup>st</sup> NAI Group Enters 2020-2035)

					Africa

NA1 1st Group  
Enters 2050-2065

Note that India  
comes in one period  
after China

**GTSP**

Global Energy Technology  
Strategy Program

# Scenario Set 2, 550 ppm

**Battelle**

**Pacific Northwest National Laboratory**  
Operated by Battelle for the U.S. Department of Energy

# Scenario Set 2, 550 ppm Global Carbon Price

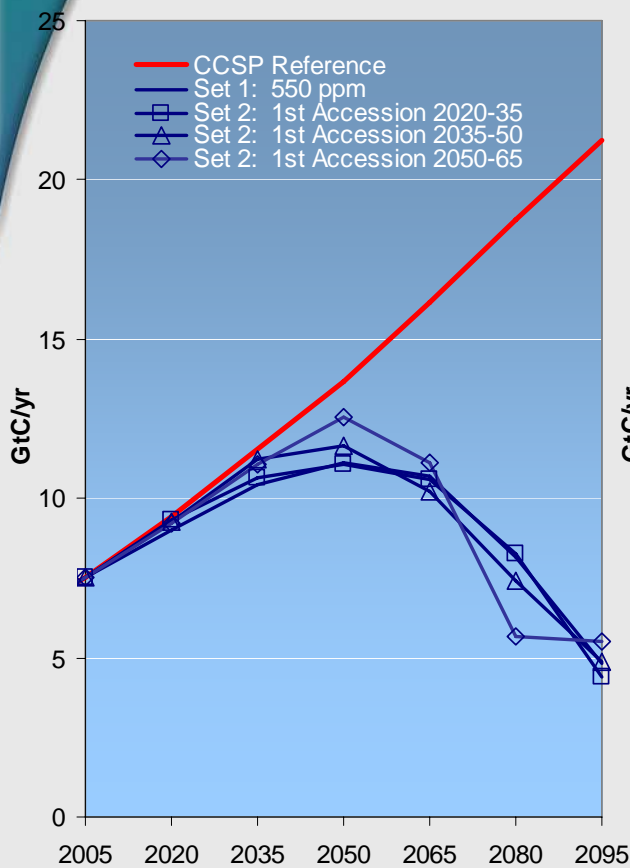

Effect on carbon prices is not extreme in the 550 scenario

# Scenario Set 2, 550 ppm Fossil & Industrial CO<sub>2</sub> Emissions

Global

USA

India

Carbon leakage

Late accession means precipitous drop in emissions

**GTSP**

Global Energy Technology  
Strategy Program

# Scenario Set 2, 450 ppm

**Battelle**

**Pacific Northwest National Laboratory**  
Operated by Battelle for the U.S. Department of Energy

# Scenario Set 2, 450 ppm Global Carbon Price

Maximum price just as Non-annex 1 accession begins between 2035 and 2050

Set 2 1<sup>st</sup> Accession 2050-65 is infeasible!

# Scenario Set 2, 450 ppm Fossil & Industrial CO<sub>2</sub> Emissions

Global

USA

India

# Scenario Set 2, 450 ppm Fossil & Industrial CO<sub>2</sub> Emissions

Global

USA

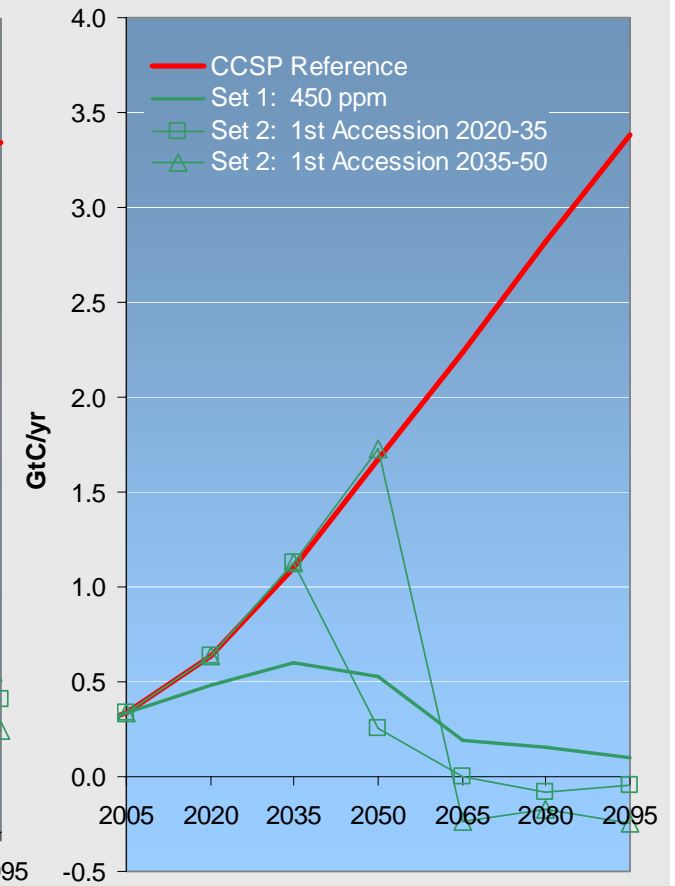

India

25

— CCSP Reference

Two periods of delay mean 2/3 reduction in US emissions by 2020.

Accession delay past 2050 is totally infeasible for 450 ppm.

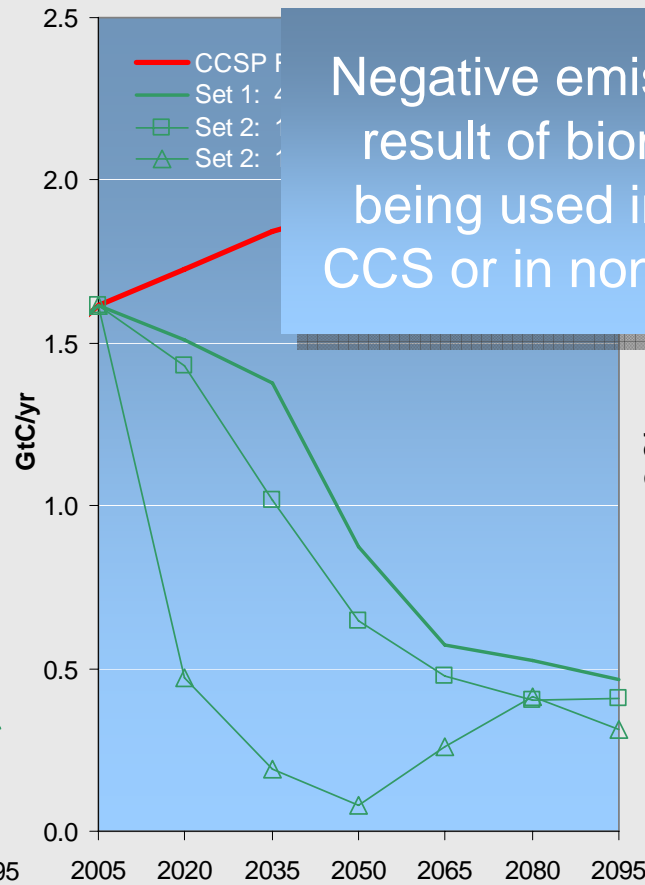

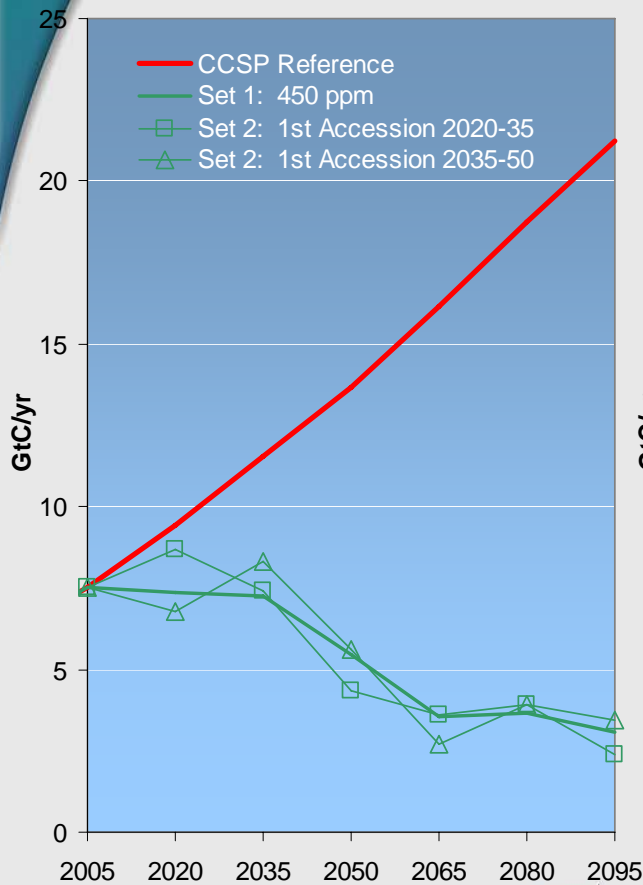

# Scenario Set 2, 450 ppm Fossil & Industrial CO<sub>2</sub> Emissions

Global

USA

India

Negative emissions are the result of biomass energy being used indirectly with CCS or in non-energy uses.

# Carbon Prices in the Annex I and Non-Annex I

- ▶ Graduated accession or differentiated regimes means different prices in different regions.
  - What does this imply for technology strategy?
- ▶ Annex I faces carbon prices of over \$1000/tonne C with no abatement in non-Annex I countries.

Global

**GTSP**

Global Energy Technology  
Strategy Program

# Stabilization Set 3 Graduated Accession + Differentiated Prices

**Battelle**

**Pacific Northwest National Laboratory**  
Operated by Battelle for the U.S. Department of Energy

# Stabilization Scenario Set 3

## Graduated Accession + Differentiated Prices

- ▶ Stabilize CO<sub>2</sub> concentrations
  - 450 ppm, 550 ppm, 650 ppm.
  - Sectoral carbon prices—All EQUAL.
  - Regional carbon prices—each region separate.
  - Time path of carbon prices
    - Annex I follows Peck-Wan-Hotelling.
    - Other regions carbon price proportional to relative per capita income.
  - Staggered accession based on per capita income.
    - Alternative accession cases—first group enters: 2020-2035, 2035-2050, 2050-2065

Difference  
with Set 2

**GTSP**

Global Energy Technology  
Strategy Program

# Scenario Set 3, 450 ppm

**Battelle**

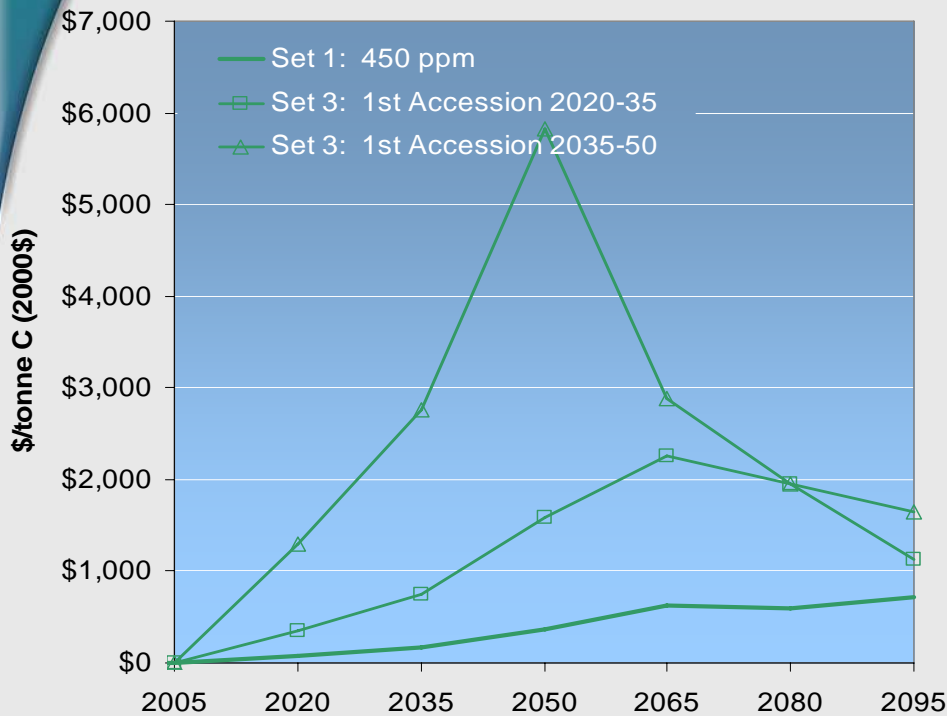

**Pacific Northwest National Laboratory**  
Operated by Battelle for the U.S. Department of Energy

Highly differentiated pricing between Annex I and non-Annex I

# Scenario Set 3, 450 ppm Carbon Prices by Region

USA

India

Set 3 1<sup>st</sup> Accession 2050-65 is infeasible!

There is little difference in the Set 3 global emissions path from Set 1, however USA emissions must be much lower with ANY delay in non-Annex 1 accession.

# Scenario Set 3, 450 ppm Industrial CO<sub>2</sub> Emissions

## USA

## India

**GTSP**

Global Energy Technology  
Strategy Program

# The Costs of Stabilization

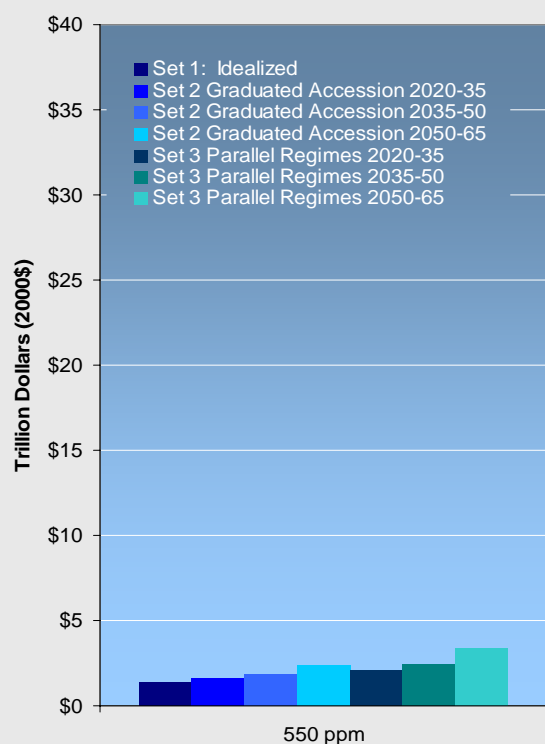

**Battelle**

**Pacific Northwest National Laboratory**  
Operated by Battelle for the U.S. Department of Energy

# Inefficient Participation and the Total Costs of Stabilization

Post 2050 non-Annex 1 accession not possible under the reference assumptions

The dominant determinant of cost is the stabilization level.

# Inefficient Participation and the Total Costs of Stabilization

The relative effect on cost increases as the stringency of the limitation rises.

All costs normalized to the idealized cost at the concentration.

# Final Observations

- ▶ “Second best” is just that, second best.
- ▶ Near-term prices of carbon depend on expectations about the future—including international emissions mitigation architectures and long-term stabilization goal.
  - Inefficiencies matter more for 450 ppm stabilization.
- ▶ Prices could vary regionally.
- ▶ What does this all mean for technology strategy?

**GTSP**

Global Energy Technology  
Strategy Program
